

# Explore the value of Puppet Enterprise

Tens of thousands of companies have adopted or evaluated open source Puppet for configuration management and data center automation. Over time, many users find they require the enhanced capabilities and enterprise support available only with our commercial product, Puppet Enterprise.

## Start managing your infrastructure a new way

Puppet Enterprise is a complete enterprise solution that helps organizations adopt DevOps practices and deliver new applications and features to your customers, faster and more reliably. You get all of the benefits of open source Puppet, plus out-of-the-box capabilities including commercial-only enhancements, supported modules and integrations, and the assurance of having a fully supported platform.

### Orchestrate deployments

Puppet Application Orchestration reduces the complexity of deploying and managing distributed applications that span nodes. Easily model application infrastructure based on its desired state and coordinate ordered deployment of configurations to ensure that the right things happen in the right order on the right machines.

### Easy systems management

Node Management with Puppet Enterprise makes it easy to group and manage large numbers of frequently changing systems. A rules-based node classifier groups nodes based on key characteristics, giving you a powerful and scalable way to automate classification of your nodes.

## Code management across environments

Code Management with Puppet Enterprise makes it easy to review, test and promote the Puppet code that defines your infrastructure across environments — from development to testing to production. This gets infrastructure code from your laptop to production faster, improves consistency, and makes deployments more reliable.

## Graphically visualize infrastructure as code

Puppet Enterprise delivers new reporting to help you truly understand how your Puppet code is architected. Visualize your infrastructure code to understand dependencies, troubleshoot, optimize code, collaborate and respond to changes faster.

## Control access at a fine level

Granular role-based access control (RBAC) integrates directly with Active Directory and OpenLDAP, providing assignment of permissions across individuals and groups. RBAC ensures that tasks are safely delegated to the right people.

## Get visibility into your current state

Quickly understand and act on changes occurring in your infrastructure. With event inspection, visualize changes to nodes, classes and resources so you know exactly what changed, where and how. Drill down to evaluate the scope of change, so you can quickly restore and improve service levels.

## Quickly provision systems across your infrastructure

With support for Docker containers, AWS and Microsoft Azure cloud resources, VMware vSphere, and bare metal servers, Puppet Enterprise cuts provisioning time to minutes and gets your infrastructure up and running faster.

## Puppet server tracking: health and performance

Troubleshooting issues with the Puppet Server is easy with Puppet Server Reporting. Get real-time, easy-to-read insight into the volume of requests, duration and execution time for configuration management functions. Share insights cross-functionally to improve performance.

## Get enterprise support for modules

With Puppet Enterprise Supported modules, common services are easy to set up, configure, and manage. These modules are fully supported by Puppet and/or our technology partners.

## Scale out with confidence

Leverage the multi-master installer and deploy Puppet Enterprise easily to thousands of nodes. The master/agent architecture allows for redundancy in the components responsible for compiling Puppet code or managing nodes.

## Monitor and manage in one location

The Puppet Enterprise web UI is your central place to manage and get real-time visibility into the current state of your infrastructure. It delivers fast access to Puppet Enterprise capabilities, interactive reports, and provides easy deployment of configurations and applications to servers and network devices. You get detailed reporting of assets to help with audits and compliance.

## Integrated tools deliver faster time to value

Puppet's Partner Network supports a rich ecosystem of technology partners to provide customers with complete solutions for DevOps, cloud management, continuous delivery, networking, storage, regulatory compliance and provisioning.

## Get peace of mind

The Puppet community is a great resource for connecting and sharing with other Puppet users. In businesses where critical applications run, sometimes you need more specialized help. Puppet Enterprise support gives you access to professional support engineers, all updates and upgrades, plus a private support portal and knowledge base.

## Puppet expertise at your fingertips

Puppet Professional Services can help with your Puppet Enterprise deployment, upgrades, customization and education. Puppet Training delivers instructor-led courses, public and private trainings, and live virtual classes. Get help developing your Puppet expertise, and achieve automation success with Puppet Enterprise.
