

DT-600 WDT-600 WDT-600W

Instruction Manual

The DT-600, WDT-600, and WDT-600W delay timers are used for solo shooters that need time between calling for a target and the firing of the trap machine. The DT-600 requires an input source such as a push button pull cord. You may also hook up a positively released receiver if you are using a positively fired machine. This process is explained below.

The **Red** and **Green** input wires are used to activate the timer. The **Black** wire is used if you would like to connect a wireless receiver to a positively fired machine.
