

Air Cylinder Force

Extension and Retraction – 60 to 130 PSI Pressure Range

Cylinder forces are shown in pounds for both extension and retraction. Lines in bold type show extension forces, using the full piston area. Lines in italic type show retraction forces with various size piston rods. Remember that force values are *theoretical*, derived by calculation.

Pressures along the top of the chart do not represent air supply pressure; they are differential pressures across the two cylinder ports. In practice, the air supply line must supply another 5% of pressure to make up for cylinder loss, and must supply an estimated 25 to 50% additional pressure to make up for flow losses in lines and valving so the cylinder will have sufficient travel speed.

For good design and highest circuit efficiency, open the cylinder speed control valves as wide as practical and reduce the pressure regulator setting to as low a pressure as will give satisfactory cylinder force and speed.

For pressures not shown, use the effective areas in the third column as power factors. Multiply effective area times differential pressure to obtain theoretical cylinder force.

Piston Rod Dia., Ins.	Dia., Ins.	Effec. Area, Sq. Ins.	Pressure Differential Across Cylinder Ports
