

## RCS V-Key Access

Revenue Control Systems ON-Site System option, V-Key Access will allow a customer to use their cell phone to enter a facility with just one click from anywhere. No need to type a code into the actual keypad.

The customer saves the app to their device and enters their code and the code will be saved. Anytime the customer wants to gain access to a facility they simply open the application on their phone and press 'Send Code', their code will be sent and the corresponding gate will open. The customer can enter their code from anywhere because the app on their phone uses a server to securely transmit their code data to the access control system. This is handy when your customer has a moving truck coming to drop off items to their unit, this way they can easily open the gate without being present. It allows for smoother and easier operations at your facility. Also with this option the facility manager is able to see all transactions at the facility from anywhere. This is useful if the manager is out of the office, they are still able to monitor the facility's transactions and be aware of who is coming and going. This option requires our server running in the background of your facilities desktop computer and would securely transmit the System Manager controller to process codes and transactions.

- RCS V-Key Access is only compatible with RCS On-Site Keypad brand.
- There is no additional hardware needed.
- User codes will be processed by the system as if they were typed into the actual keypad.
- Codes can be 1 to 10 digits long.
- Read range is unlimited.
- Multiple gate and sites can be configured.
- App can be customized for your facility location with logo, website, and other links.
