Product Highlights: U-FLASH

Quick info on the RCS U-FLASH Access System.

U-FLASH Access Control is a unique system in the market today. What makes U-FLASH different is that it **DOES NOT** require communication cables or internet connection. This makes it ideal for remote locations where it would be difficult or expensive to run wires out to the unit (dig up concrete) or pay a monthly internet fee. U-FLASH is a stand alone system which is updated with a USB flash disk that stays within the unit. This disk can hold up to 5,000 user codes, 1 to 10 digits long, and has an unlimited transaction history. The system can manage up to 32 access points (64 for dual units). The newest feature of the U-FLASH access system is the ability to open a gate from your phone via Wi-Fi. Each time you approach the gate your phone will automatically connect to the Wi-Fi, simply open the app on your phone and your code will be sent and the gate will open.

What does this mean?

- Communication is never lost
- No monthly internet fee
- No need to dig up concrete or run communication cables to the unit
- Simply insert the disk in the unit and the system is active
- With Wi-Fi option there is no need to type code in physical keypad

How it works:

1. Load user codes onto the flash disk from the KP-Control software on your office computer by simply clicking the "Update USB Drive" button

2. Bring the disk out to the U-FLASH unit and insert the disk in the secure USB port located inside the unit
3. Close and lock the unit and type in a test code to ensure proper functioning
4. Your system is active!

Our U-FLASH Access System is also available in "mini" version. This system works the same as any U-FLASH system but does not have a display and the flash disk is only inserted when programming the codes to the unit. This unit can hold 2,000 user codes. It is weather proof and made for the outdoors. There is an easy to see LED which will signal red for bad codes and green for good codes, as well as when codes have been programmed.

Tips and Tricks: When adjusting your cameras make sure they are not pointing at the sky. You want to make sure all angles of your property are being covered by a cameras. Also when having cameras installed make sure they are easily accessible for service and maintenance. To make sure your cameras last, periodically look at each camera and make sure its mounting is secure and the cable and conduits are secure, clean off the glass lens and check to see if it is damaged by the sun.
