

EXCALIBUR 3000

EXCALIBUR 3000 – is an industrial grade acid cleaner-deruster concentrate designed to clean and prepare a dirty, rusty part for subsequent painting or finishing.

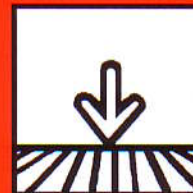

When diluted with water, this “triple-action” product will give effective performance value in **CLEANING – DERUSTING – SURFACE TREATMENT**.

CLEANING – Excalibur 3000 has solvent/detergent properties which make it extremely effective for removing stamping and foaming oils, rust preventatives, carbon smuts, soldering and welding fluxes, identification inks and most other oily soils. It effectively removes and disperses the dirt leaving the metal surface ready for further treatment. The oils are emulsified so that re-deposition does not take place.

DERUSTING – Excalibur 3000 contains acidic ingredients that work on rust, heat scale and similar oxides. The oxide removal takes place simultaneously with oil removal thus reducing cleaning time substantially from a two step process. This derusting takes place without the use of dangerous and difficult acids like muriatic and sulphuric. Excalibur 3000 incorporates the best features of safer acids plus accelerating agents to promote quick oxide removal.

SURFACE TREATMENT – Excalibur 3000 microscopically etches the metal surface thus providing an excellent condition for paint adhesion. A passivating action also takes place which provides a surface less prone to under deposit corrosion once it is painted. Excalibur 3000 also effectively cleans and conditions aluminium for resistance welding operations or for acceptance of conversion coatings.

Excalibur 3000 contains a special inhibitor to prevent excessive attack on ferrous metal surfaces and also to help prevent rerusting. It's built-in soil redeposition preventative properties provide a clean free-rinsed surface.
