## Interesting and worth knowing about viruses and bacteria

Seven hundred and thirty-fifth contact  
Friday, April 3, 2020, 23:48 h

Ptaah here I am, Eduard, greetings. You have called me through Florena, dear friend, what is so urgent?

Billy First of all, greetings and welcome,

Ptaah, my friend. Look here, I received this fax from Elizabeth, and I think that an urgent answer might be necessary, because if such thoughts are cherished as they are written in this fax and possibly spread, nasty misunderstandings and fear will arise. But we have to prevent that, and for that purpose it will be necessary that you explain in more detail what you explained in our last conversations about what is mentioned in this fax. Unfortunately, it is always the case that when something is explained, it can never be enough, because from everything and everyone, unthoughtful assumptions, crooked thoughts and wrong interpretations are made. And this usually always happens, because effective and real deep thinking and reasoning and fathoming something explained is not the strength of many people on earth.

The whole of the fax that Elisabeth received by e-mail refers to what you explained on February 3 under point 17)

:17) Our observations and findings also show that the corona virus in the human organism, which changes genetically in two parts, behaves very aggressively to fatally, depending on the corresponding immune state, as well as reluctantly, whereby a recovery is formed, although this does not correspond to a complete destruction of the virus. Our findings show that certain genetic variants do not die off during recovery, but remain latently present, but are not immediately recognizable or detectable, as is the case with various other diseases. In the case of this insidious corona epidemic, however, it can happen unexpectedly some years or decades later, e.g. through intimate contact, that the latent, dormant evil can be transmitted, but then an unusual type of phenomenon occurs: as a result of the altered genetic variations of the known virus, a disease reaction occurs in a completely different form. However, this fact cannot be grasped by terrestrial research using medical and virological apparatus and other technology, because according to our

predictions, the instruments required for this cannot yet be developed and constructed in the current third millennium. Although the people on earth think that they have at their disposal a highly developed technology with very highly developed technical values, but what is the truth is that the entire earthly technology of any kind is no more than a first step out of deepest darkness into a faint glimmer of a still very distant light.

That, dear friend, is in my opinion the reason for the fax, which you should please read ...

Ptaah...(reads)

These values have been entered:

First and last name: A. B.

Preferred language: English

Your message to us:

I would like to ask some questions regarding the new vital information concerning the disease that has been published on the FIGU website:

1) Since, on the basis of such recently published information, the virus is rapidly mutating and becoming more aggressive, and it also behaves differently depending on the immune system of the respective peoples, one could assume that if at some point a vaccination is found, it will not be effective or only partially effective, i.e. that healthy people will either not or only partially protect themselves from the virus infection, because in the meantime the virus has already mutated to such an extent that the vaccination does not provide effective protection. If this were the case, it would mean that possibly only some pharmaceutical agents or drugs could treat and cure the virus disease.

2) What is the actual situation in this regard?

3) According to a statement I recently made on the English FIGU-FORUM in a post from the moderator who quoted a telephone information from a FIGU KG member, there are

currently several million infected people worldwide. And because of the above mentioned Plejaren source of information, it is so that in the body of the people infected by the virus, traces of the virus remain in the gene structure and therefore the disease can reappear after years and the infected people can infect others even after recovery, although they have no more symptoms, result negative in the virus test and are therefore cured for the earthly medicine. The vaccination could only be administered to healthy people and not to those who have recovered from the virus disease, who are still infectious and therefore carry the disease forward for a long time in the future. This seems to be a hopeless situation, unless some drug is discovered and applied that is able to destroy every trace of the virus in the body genetics from the ground up.

Yours Sincerely A.B.

This is indeed thoughtless, unpleasant and annoying, and is in line with what you have said, that assumptions, wrong thoughts and interpretations will be devised that can cause fear and disaster, so obviously a further and more comprehensive explanation will be inevitable.

Billy precisely..

Ptaah That is what I will do, and in...

Billy I thought yes you would not say no because it is really necessary. But I have to ask you to explain it in a language the earthlings can understand and in sufficient detail, as it is always necessary. Certainly, questions will arise again, even if nothing more will be misunderstood, because on the one hand, one or the other thing is not understood.

Ptaah This will be so, as well as that elements will question everything stupidly-boldly, in order to make themselves important with it, but on the other hand, it will lead further, namely, that elements, which have become addicted to a know-it-all urge, will think up false theories and spread false information. Unfortunately, it will also be the case that experts will not accept the truth, because they are not able to access teachings that are incomprehensible to them, or to consider unknown, foreign insights and higher knowledge that have been brought to them, and therefore cannot accept them in their arrogance.

Billy That will be the case, as they will probably also claim in their narrow-mindedness that everything is nonsense and only a work of my imagination, etc., as is also claimed in this or that way with regard to our contacts, which are disguised as deception, imagination, fantasy, delusion, lies and cheating. And as you know, this is still happening today, even though for our contacts there are not only photographs and reports of experiences of many people who have experienced various things in connection with our contacts, which was effectively

more than just extraordinary. Witness reports, not only from FIGU members of the core and passive groups from all over the world, but also from persons independent of FIGU, prove that everything concerning our contacts is true. All this and much more, but it will not be of any use if there is no attempt to tear me apart with regard to the statements you are making worldwide about the Corona pandemic.

Ptaah What you are saying is unfortunately already so today due to the double bean-straw stupidity of those who deny the truth, who search your web presence on the Internet and gain knowledge from it, while others insult you, and especially you, as a large number of politicians and heads of state do, as we have been observing for decades. This is also the case in so-called UFO-groups, which deny you and our contacts on the one hand because you have been slandered by your former wife and former friends of hers and by members who have fallen in love with her, on the other hand by envious people and by any pathological but unfulfillable wish to be in your place etc.

Billy Good, that's what you said now, and the "double bean straw stupidity", you obviously like that, but we really shouldn't keep on talking about it, even if I briefly touch on something, regarding the fact that our contacts are doubted. It's just not good if every time again my ex and the antagonists, who are unanimously in agreement with her, as well as the other adversaries and the Christian-religious Mephistopheles who believe her, who call themselves theosophists and sect fighters etc., are brought into the field. It... well, I think that you...

Ptaah I'm sorry, it wasn't my intention to meet you. You have rebelled against it several times, but sometimes I am simply urged to tell the truth because you do not openly defend yourself against the insults, lies and slander and do not pay attention to the hostility directed against you, which can always and at any time degenerate, as has happened 23 times. You should consider that, my friend.

Billy I do, but what has been said now should be enough, please.

Ptaah I ..., yes you are right. Then I will try to interpret what I said in our conversation on February 3rd in more detailed explanations and in a use of words that I can assume will be understood. I will start by explaining again some things worth knowing about viruses and bacteria, using the usual earthly terms for certain explanations:

Concerning viruses, as I already explained on February 3rd, these simple infectious organic structures correspond to and are therefore completely different from bacilli or bacteria. Viruses correspond to inanimate structures, which have one or more molecules in them, which are found in some of the 2.7 million species and various

forms, such as spheres, rods or tail carriers etc. -The molecules given in the structure are carriers of deoxyribonucleic acid, deoxyribonucleic acid ep. the DNA corresponding to a double strand, and ribonucleic acid, ribonucleic acid ep. The RNA, which as a rule has only one strand, but both carry the bases adenine, cytosine and guanine.

There is a big difference between viruses and bacteria, because unlike bacteria-the living beings are made up of their own cells, have their own metabolism and thus their own energy production and are therefore capable of protein synthesis-the viruses, which are only 300 nanometers in size, have no such capabilities as organic structures and have no life what-so-ever.

Viruses exist everywhere, but only a small number of the 2.7 million or so species attack humans, making them truly sick or dying. And when a person recovers from a viral disease, it does not necessarily guarantee a complete cessation of the pathogens, because they are often excreted by infectious substances, such as excretions from excrement, breath, saliva and spit, expiratory droplets, blood from wounds, intimate acts, or a wet mouth, etc,

Viruses cause infections such as HIV/AIDS, serious gastrointestinal infections, hepatitis, measles, rubella, common cold and chickenpox, as well as deadly diseases and epidemics.

Viruses are not easy to combat with medication, not even antibiotics, because medication is ineffective in viral diseases. Although certain antiviral drugs can be used against individual types of viruses, they can really only be used against individual viruses, but these are usually "converters". This means that the viruses are constantly changing gene variably, such as the influenza virus, which is very flexible and therefore constantly creates new forms of influenza, which constantly challenge the immune system anew. And this is also the reason why each influenza vaccine is only effective for a single wave of influenza and thus only for a certain number of months, but is then completely ineffective for the next influenza generation. Therefore, the constantly changing influenza virus requires annual research and the vaccine must be adapted to its new genetically modified characteristics.

Influenza is not as harmless as is assumed due to ignorance of the earthlings, because even though it is not usually public knowledge that it can be fatal, many thousands of people die every year when waves of influenza occur. Vaccinations protect against influenza only against a one-off occurrence of the disease, not, as is the case with other diseases, where vaccinations provide protection for years. It should also be noted that the immune system cannot easily and quickly adapt to a new wave of influenza and therefore needs a long time to cope with the virus. With

other diseases, where the body's own defense can kill a germ or pathogen, the organism becomes immune to the corresponding virus in many cases.

If humans are healthy and have a healthy, high-energy immune system, it usually reacts very quickly and fights off viruses that have entered the body quite successfully. Nevertheless, viruses can still cause significant and life-threatening diseases. This means what is unknown to the medical, immunological and virological experts on earth that "triggered" and "caused" correspond to two completely different factors. "Triggered" means that a disease, which is dormant in the human organism, is activated and breaks out, whereas in the other case "caused" means that a disease is produced or "caused" by a new and actively invading pathogen in the organism and is actively treated as a disease. This is due to the fact that a once acute disease, which has recovered but has been deposited in the entire organism as a medically undetectable impulse symptom, but has been genetically altered again as such or as a result of an impulse symptom change, is triggered as a new altered disease. This is, however, unknown to the entire terrestrial medical, immunological and virological sciences, but I will go into this in more detail later in connection with the corona virus. viruses penetrate not only into the organisms and thus into the cells of humans, but also into all genera and species of mammals, animals and countless other life forms, such as plants of all kinds. If viruses do not find any host cells in their environment, wherever they exist or in any living creature, then they atrophy and dissolve in their organic structure, because they cannot die and die because they are effectively lifeless and not living beings. So all explanations of earthly specialists in this regard are complete nonsense, that viruses die and die in the absence of host cells, because what does not exist in the true sense of life cannot become lifeless and cannot die either, but only wither and dissociate, decompose and dissolve. When viruses enter a body and dock to host cells, the entire organism is infected and multiplies rapidly, causing the cells to produce the structural elements required by the viruses. Once the viruses have released their genetic material in the host cells, the host cells have to produce an uninhibited number of virus particles and combine them to form new viruses, after which the host cell dies and thousands of new viruses are excreted. These viruses immediately seek out new host cells, such as muscle cells, liver cells or others, as well as red and white blood cells. When people become ill from viruses, they usually become infectious and transmit the pathogens directly or indirectly to other people or possibly to other living beings. Recovery from a viral disease does not necessarily guarantee the complete cessation of the pathogens, because they are often still excreted by infectious substances, such as excretions from excrement, breath, saliva and spit, expiratory droplets, as well as blood from wounds, intimate treatment or a wet pronunciation, etc, If a person is infected by the corona virus or another virus and survives to recover from the disease, this is not due to any medications that are directly directed against the virus, that are beneficial and used to kill the virus. Such

medical remedies do not exist, because a virus is not a living being, but an infectious organic structure which, unlike bacteria, cannot take in food and therefore cannot take in medicine, and has no metabolism. Therefore, recovery can only take place when the immune system fights the whole of an existing viral activity, if it has the energy and strength to stop the virus from functioning in such a way that it becomes paralyzed in the human body. Only in this respect can medicines containing antibodies be useful, if they strengthen the immune system and make it more resistant, so that the immune system can cause viral paralysis. A virus can no longer have any effect if it is completely paralyzed, because an absolute functional negative state prevents any movement and the entire structure of the virus dissolves and thus no longer exists. Consequently, it is clear in the entire human organism as in other living beings that when this structural dissolution takes place, the virus can no longer be detected in any way, except when antibodies are formed in the fight against certain of the 2.7 million types of virus. In the case of recovery, as I have already pointed out, the fact is that once a disease has been acute and has recovered, it can no longer be medically detected, even though impulse-symptomatic virus has been deposited throughout the organism. Such depositions, which are to be called impulse-symptom-transformation, do not turn out to be pathogens, but, as the explanation says, only as vibration-conditioned impulse-symptoms, which have superfine frequencies and can only be determined by appropriate equipment. Such apparatuses are neither known to the corresponding earthly techniques and sciences nor are there any approaches to knowledge about them. The deposits of impulse symptoms and their transformation with genetic changes are also completely unknown to the terrestrial medical, virological and immunological sciences. Consequently, these impulse symptoms last a lifetime and can cause new, but changed diseases, not the original one from which these impulse symptoms originated, but as a result of the gene variations altered by the transformation, which can attack the organism in a weak immune system. This is, however, as already mentioned, completely and absolutely unknown to the entire terrestrial medical, immunological and virological sciences, but it does not mean in any way that the human being is marked by the virus, because the whole thing only remains as an image of the virus-gene change or as a vibration-related impulse symptom in the human organism, without the risk that it could become active again in its original form.

However, this can no longer be medically and virologically determined or proven, because it is effectively a virus-image symptom that can only be detected by frequency detection equipment due to its extremely fine vibration, although the entire sciences of terrestrial electromagnetic technology, medicine, virology and immunology, chemistry, etc. are currently involved. Only the impulse-symptoms caused by the vibration are established in the whole organism, as it is inevitably the case with any virus disease, but these impulse-symptoms remain, and that without causing any damage, This means, however, that these impulses can, at the right

time and with the right opportunity, as a result of their mutation in the gene variations, promote other and new diseases and help them to actively break out, but I must repeat that the entire terrestrial medical, virological and immunological sciences have no knowledge of this, nor of the fact that the mutations and newly arising gene variations emanating from the virus are stored in the human organism as impulse symptoms, and that this is the case throughout the life of the human being. It must therefore be made clear that this storage is not a pathogen itself, but only an impulse-symptom oscillation that is integrated into the entire organism. As explained, however, it is not a persistent direct pathogen, but only a dormant factor of impulse oscillations, which can possibly serve as an indicator for the triggering of germs that are present underground or that have newly penetrated the organism. However, the whole thing can also be such that the original disease, which had arisen from a virus attack and created impulse-symptom oscillations, can be caused again by a new infection, if there is no appropriate medication and thus no purpose-related vaccination, and consequently a new similar disease can occur. Only in this way can a susceptibility to another similar infection or to a similar or completely new disease be given, if an infection is not preventively prevented by a purpose-related vaccination, whereby germ-corresponding vaccinations must be repeated from time to time, because the effectiveness of certain vaccinations diminishes after a certain time and a routine refreshment must be carried out, such as a tetanus vaccination, which loses its protective effect after 8 to 10 years, depending on the condition of the immune system. So a basic tetanus vaccination does not mean that it would offer lifelong protection against tetanus spasmodic bacteria. All of this, my friend, was in my opinion still to be explained, with which everything necessary should now be explained to prevent further proliferation of unreasonable interpretations, fears and theories.

Billy What you have explained everything, that should really be enough. On the other hand, however, it will be the case that the majority of the so-called specialists such as doctors and other physicians, virologists, immunologists, chemists and all sorts of know-it-alls, as well as wisdom crackers etc. in their narrow-mindedness will knowingly deny everything and condemn it to the realm of fantasy and illusion.

Ptaah This will be so, for know-it-all, as you rightly call the behavior of such earthlings, corresponds to a delusion of arrogance and a self-opinionated claim to be in possession of an all-knowing.

Billy That is well said, but I would like to expand on this by saying that such earthlings consider themselves to be nincompoops and incompletely clever, but who in reality are only stupid sayings, wise noses, quibblers, hair-splitters, pedants and syllabians, as well as paragraph riders and seven righteous people, as you have said. Basically, however, they are nothing else than word twisters, critics, principled and nagging people, and that says it all: What I still have here is this

advertising double (Corona-Virus: Bacteria are virus catchers) -Interview with Dr. Anne Katharina Zschocke. If you want to read this advertising stuff and tell your opinion about it, please,

Ptaah, I can do that ... .. It is incomprehensible that such half-truths and partly nonsense can be spread. The nonsense alone: (There are no good and no bad strains of bacteria, none that make you sick or that make you healthy, and certainly none that attack anyone. Microbes do not fight each other either.)etc. is so absurdly nonsensical that the prospectus is not only maliciously misleading, but should be prohibited. I am forced to explain some things: The claim that there are no good and no bad strains of bacteria is a bold lie, because some bacteria are good and useful, others are bad, harmful, even dangerous and deadly.

In relation to humans alone, bacteria are both useful helpers and disease-causing agents, which in a number of well over 100 trillion per person as tiny, nasty and harmful pathogens, or as good and even very necessary and vital living beings, populate his entire organism, starting from the skin to the heart and all the organs, whereby the most important bacillus-carrying factors are the intestines and the stomach.

There are also numerous bacteria on the skin of the body, billions of them, which form a protective film and normally repel pathogens, as I have already explained on 3 February in connection with disinfectants which kill the vital skin bacteria when disinfecting hands with disinfectants.

Good and useful intestinal bacteria, such as lactic acid bacteria and bifidobacteria, are designed to displace bad and disease-causing bacteria, and also help break down food and form short-chain fatty acids that provide energy to the intestinal mucosa. Bacteria are pathogens, such as salmonella, especially in relation to colds and other infectious diseases. Most strains of bacteria are harmless or even do good and vital things, so that humans as well as all other living beings could hardly or not at all live without bacteria. The skin alone, which covers the entire body, is protected by a dense film of bacteria comprising billions of units. All bacteria have different peculiarities, which I will list as follows:

- 1) Bacteria are microscopically small creatures.
- 2) Bacteria are either good, useful and vital, or bad, dangerous and deadly.
- 3) Bacteria are unicellular organisms.
- 4) Bacteria have a metabolism.
- 5) Bacteria can reproduce themselves.
- 6) Bacteria can be up to a hundred times larger than viruses.
- 7) Bacteria multiply by cell division.
- 8) Bacteria come in many forms, e.g. coccus, rods or spirals.

- 9) Bacteria consist of a single living cell.
- 10) Bacteria multiply incredibly fast under the right conditions.
- 11) Bacteria multiply by cell division.
- 12) Bacteria are extremely adaptable and adapt quickly to any situation.
- 13) Bacteria are aerobes that require oxygen.
- 14) Bacteria are anaerobes that do not require oxygen, some can do both.
- 15) Bacteria can carry either extremely low or high temperatures.

There are many types of bacteria, but most of them have no connection with humans and therefore no awareness of their health and existence, nor of their life. The gross of all bacterial species corresponds to natural, peaceful and useful forms, while only a small number of them cause illness, suffering and death, which can be very severe in this respect. Many other bacteria are hermaphrodites between good and evil, causing problems only under certain conditions, such as if they multiply too much, if there are any changes, if their environment changes, or if a host organism decays due to weakness, etc.

The fact is that man, like all living things, cannot live without bacteria, because without stomach and intestinal bacteria alone there would be no digestion and therefore no metabolism. Already at the beginning of life, which in its origin basically came into being through the transformation of viruses, many types of bacterial strains made the emergence of the living beings developed from the first life forms possible. This has also happened on earth, and all bacteria have survived everything, and that until today, and despite all adverse circumstances, which have been caused by evolution on the one hand, and on the other hand especially during the last two centuries very catastrophically by mankind.

Among the bad and evil bacteria are of course the pathogens, especially the germ *Escherichia coli*, which causes severe infections in the gastrointestinal tract as well as in other parts of the body. Then there are the salmonellae, which cause serious illnesses as a result of poisoning, such as typhoid, paratyphoid and enteritis or intestinal inflammation, which in severe cases can only be combated with antibiotics. Caries is also caused by bad bacteria, but there are also various staphylococci and streptococci, which cause skin and mucous membrane infections, both in children and adults, where the bad gram-positive bacteria cause infections and severe and dangerous inflammations even in immunocompetent people. These are the explanations I wanted to give.

Billy Thanks for your comments and explanations, then I have another question regarding the wearing of protective masks against, excuse me my against the corona virus. You have explained a lot about this lately, but I would like to know to what extent and where it makes sense to wear such masks in the near future.

Ptaah What will make sense in this regard, I have already explained, but I would like to repeat and explain again:

When masks are to be worn to protect against pathogen infection, it is only useful if they are specially manufactured and accordingly designed, dense and suitably filtered to prevent infection. Basically, such products are only equivalent to medical masks, but suitable masks can also be used as protection to prevent secretions from the mouth and respiratory organs from being transmitted to other people at a closer distance and in terms of transmission to other people, just as suitable masks can be used to prevent secretions from the mouth and respiratory organs of other people. Such simple masks, however, do not protect against viruses and bacteria, because if this purpose is to be achieved, it requires appropriate medical masks. Simple protective masks, as I have called them, can of course be worn everywhere, but it is useless and pointless if they are worn everywhere outside and not other people or such are only widely scattered and present at several meters intervals. Wearing a high-quality protective mask only makes sense if it is used sensibly, but this cannot be the case if it is used in daily use. A necessity exists only in the case of heavy pedestrian traffic on the street and in buildings etc. used by a large number of people, precisely where it is necessary, such as clinics, supply places such as food shopping centers of all kinds, in indispensable community activities with several employees, as well as during conversations in small circles or other small groups of people, in gatherings of people, or in the close or narrow area of people affected by disease or epidemics, whether indoors or outdoors. But now, Eduard, I have to go, unless you have something else to discuss?

Billy No, I don't, but thank you very much, and Bernadette will work up what you have explained and pass it on to all FIGU members, after which it will be put on the Internet.

Ptaah Then it should be our entire conversation without any removal.

Billy You mean that the entire contact report ...?

Ptaah That is the meaning of my statement. But now, Eduard, my friend, now I really must go. Goodbye.

Billy OK, then just so. Bye, thank you and  
goodbye.\*\*\*\*\*
