

Hedderman Stucco is a division of Hedderman Engineering Inc., a company specializing in inspections of homes during real estate transactions. More information regarding our company can be found at [www.heddermanengineering.com](http://www.heddermanengineering.com). A request has been made to do a moisture analysis of the exterior stucco system of your home to determine if there is moisture and/or damage to the substrate and/or framing behind the stucco cladding. The request for our services has been requested by:

In order to perform the requested inspection process we need your permission to inspect and test the house as this requires holes being drilled in the exterior stucco veneer at various locations to access and probe the substrate behind the stucco. The drill holes are minimal in size, approximately 1/8 inch diameter, and are filled with a sealant after probing of the substrate. The above methods of testing are considered the industry standard for this type of inspection procedure.

I hereby give my permission to perform the above requested inspection.
