

DILATION

Dilation offers the most thorough, comprehensive eye exam. Dilation drops are instilled in the eye to expand the pupil to best examine the internal ocular structures. Every patient has the opportunity to be dilated at their annual exam for no additional cost. Without dilation important diseases or findings can be missed including life or vision threatening tumors, retinal detachments, and diabetes. After dilation, your vision may be blurry and you may be light sensitive. Most patients are able to drive after dilation, however, we encourage a driver if you are uncomfortable.

- Yes I would like to be dilated today
No, I am fully informed of the purpose of dilation but decline

OPTOS-RETINAL IMAGING

The Optomap is a state of the art imaging technology that photographs the majority of your retina without dilation drops. It is quick, efficient and provides a permanent digital image that the doctors will review with you. This image allows the doctor to closely follow ocular conditions year to year. As there are no drops involved, there are no side effects. This is an out of pocket expense.

- Yes, I would like to have the Optos Retinal Image for \$25
No thank you
I prefer to have dilation
I decline both dilation and Optos Retinal Screening
