A project that took functionality to the next level. This camper is designed to be arranged and configured by travelers within minutes to suit their everyday needs. By simple attachment systems, users are able to shape and design a unit that reflects their niche for adventure. We have created some of our envisioned ideas for display within this presentation for purposes of allowing customers to visualize our concept. This camper is designed to make your own for the minimalistic lifestyle.

Walking into the camper with this display, one can find mobility in the entrance area with storage lined across the walls. Moving forward there is a setup of 1 panel located hanging off the interior wall, which allows for legroom with functional seating in 3 locations. The overcab is completely empty within this image, allowing use of this area for storage with net security.

Every component –table, sleeping locations- upper or lower- left, center or right- can be utilized with this camper using our unique versa panel option.

---

This replica displays a design that allows for single bed sleeping on the left side, with storage of components and 1 seating location on the right. The electrical box is located below the bed allowing for foot room to and from the bed. The overcab displays open options for multiple uses.

---

A functional dining arrangement allows the interior of the camper to be used for eating and living within this display. A right located panel acts as a table, held up by storage components and connections located along the front wall. There are 2 seating locations provided on the left side that serve to allow one to sit and move to access storage around the camper.

A right-side single bed, allowing for complete component storage located along the left wall. This display does not present any seating locations as the 2 paneled bed stretching across the right side can be used for seating or sleeping purposes. The overcab is then left open for complete function of storage or table space.

---

A closer look at the 1 panel extended bed from the overcab. Allowing for storage underneath the bed and equipment (bike, gear, etc) storage in the center isle. There is also seating located along the left side of interior, this bed has a 6 foot length.

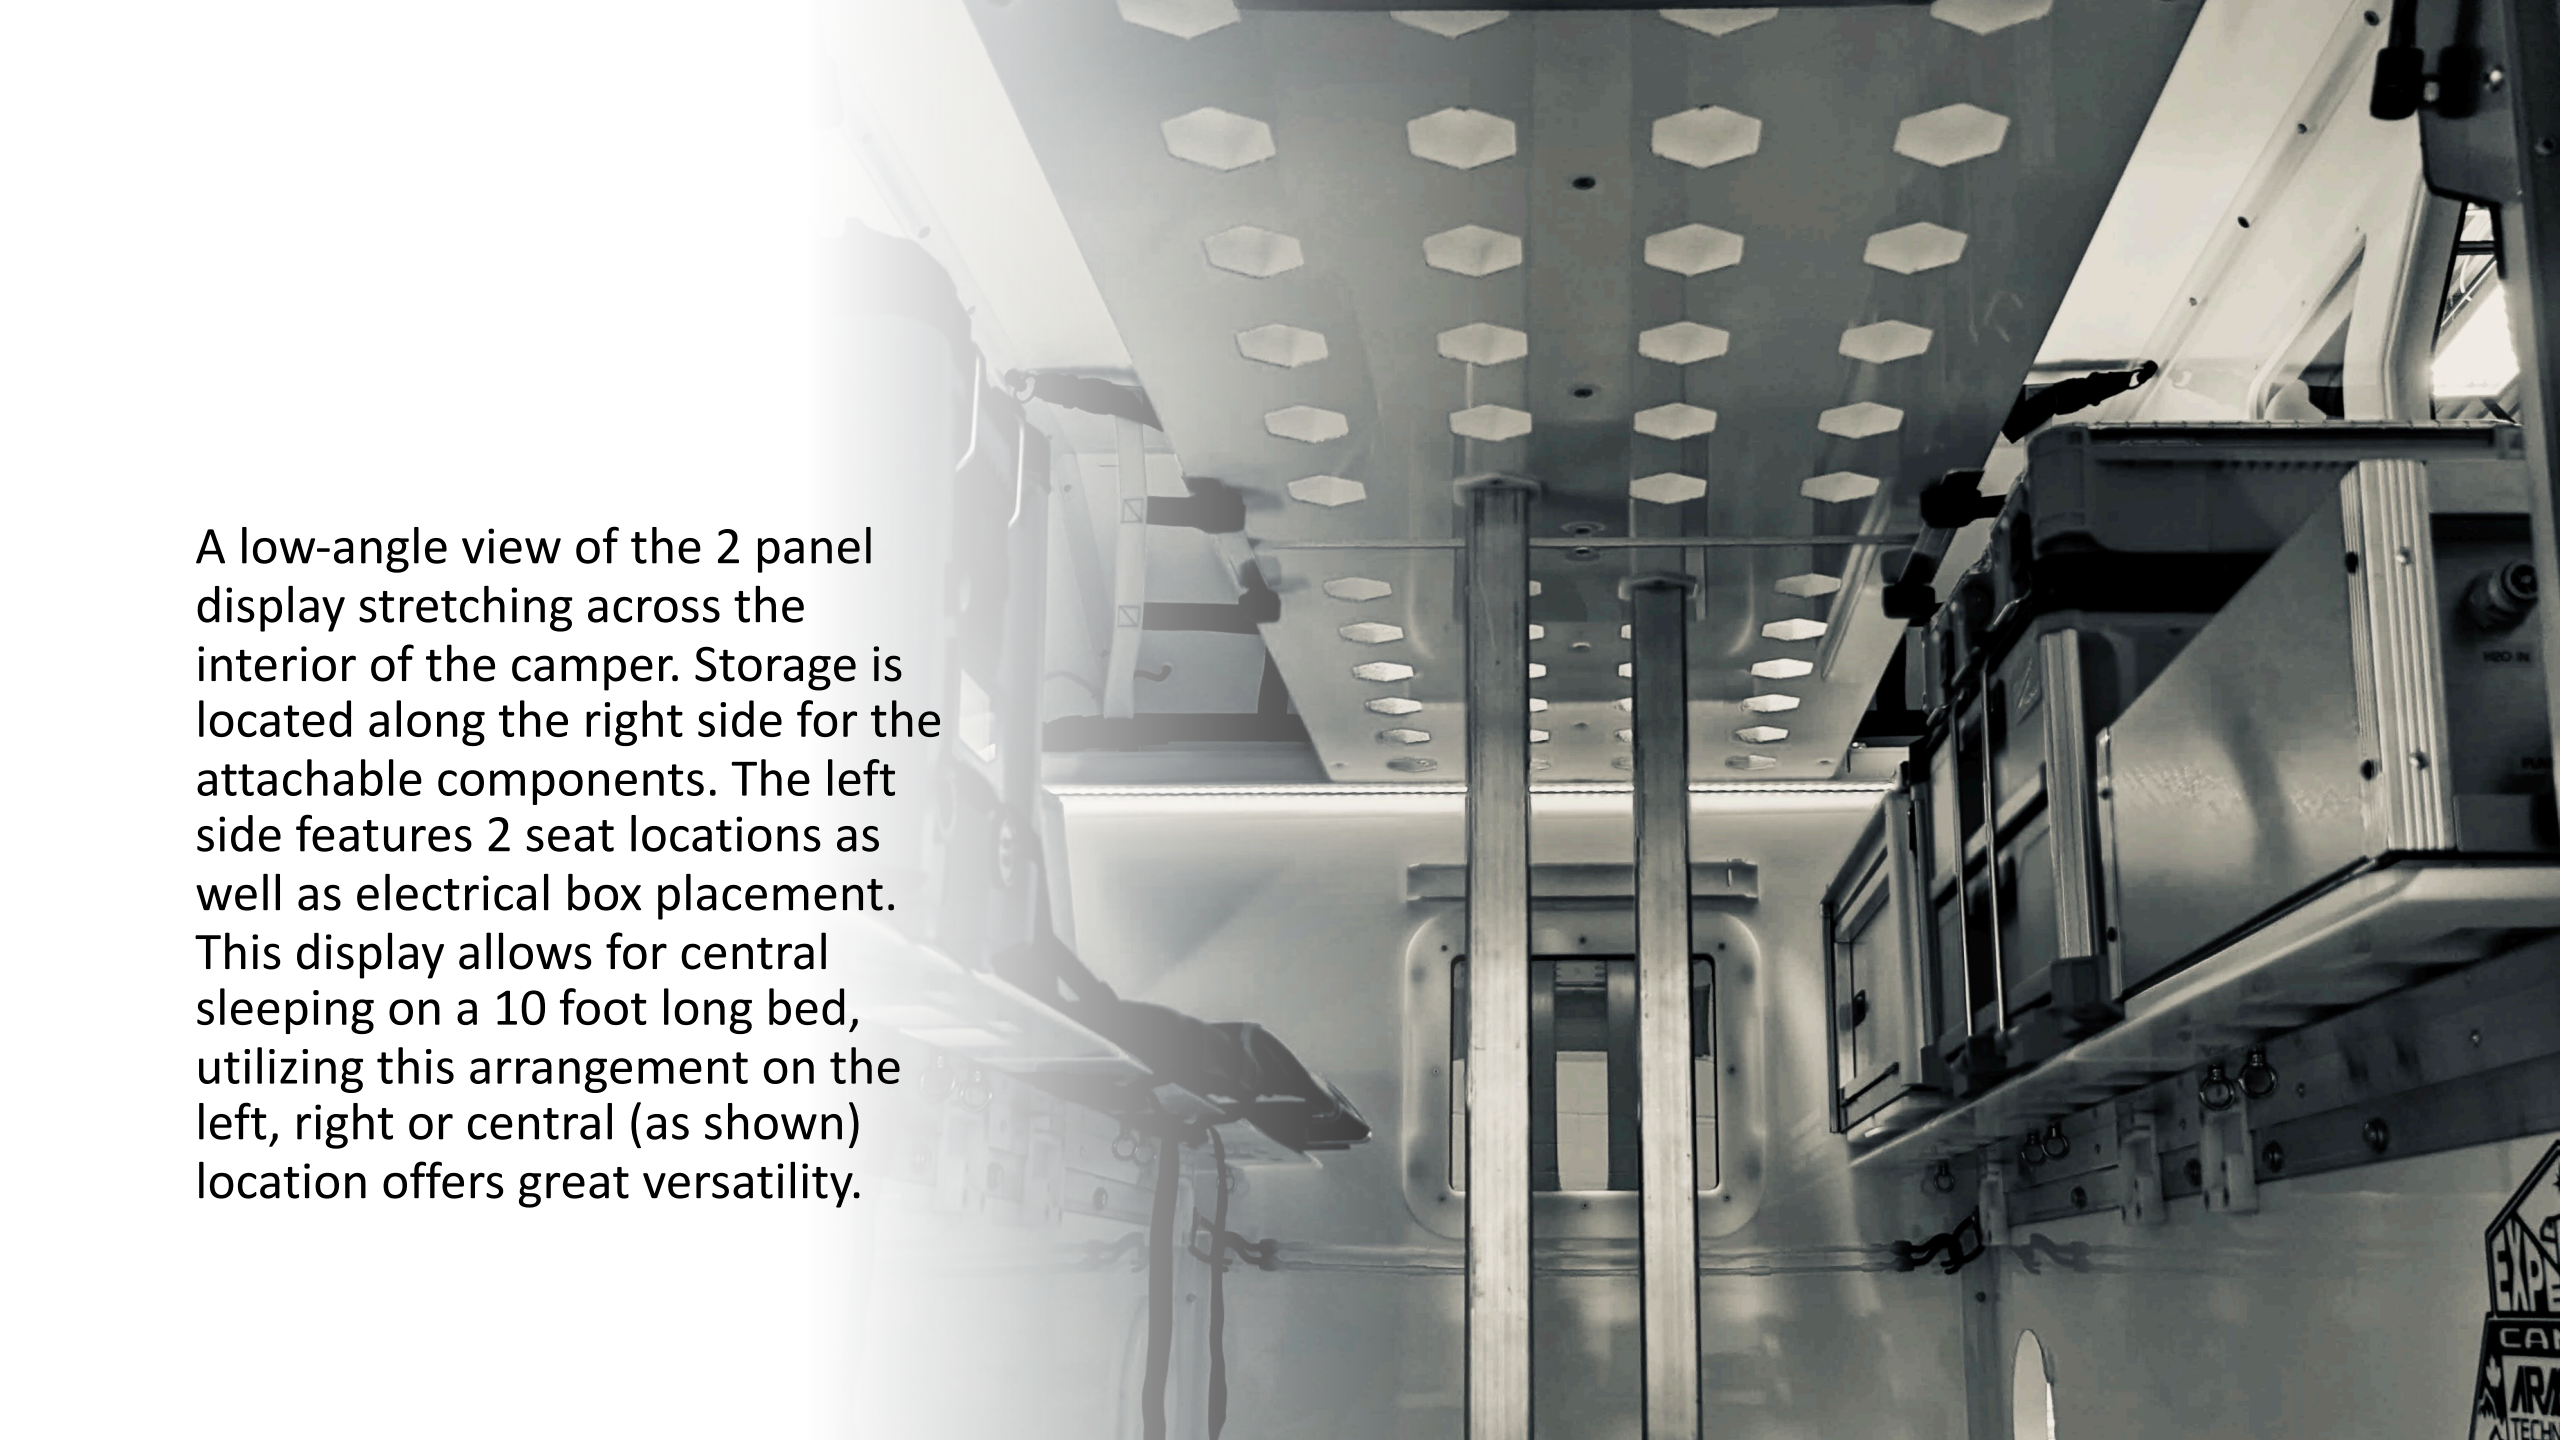

A right angle view of a 3 person seating arrangement, with the electrical components located along the left side. The storage and usage of the stove, sink and other objects are located on the right side along with 1 seating location. This feature allows for legroom of seats and a walkway along the interior of the camper and can be easily altered to allow for a panel table in the middle.

A view displaying 3 seat locations on the left side with a 6 foot long singular bed above. This allows for complete access and usage of storage along the right interior side.

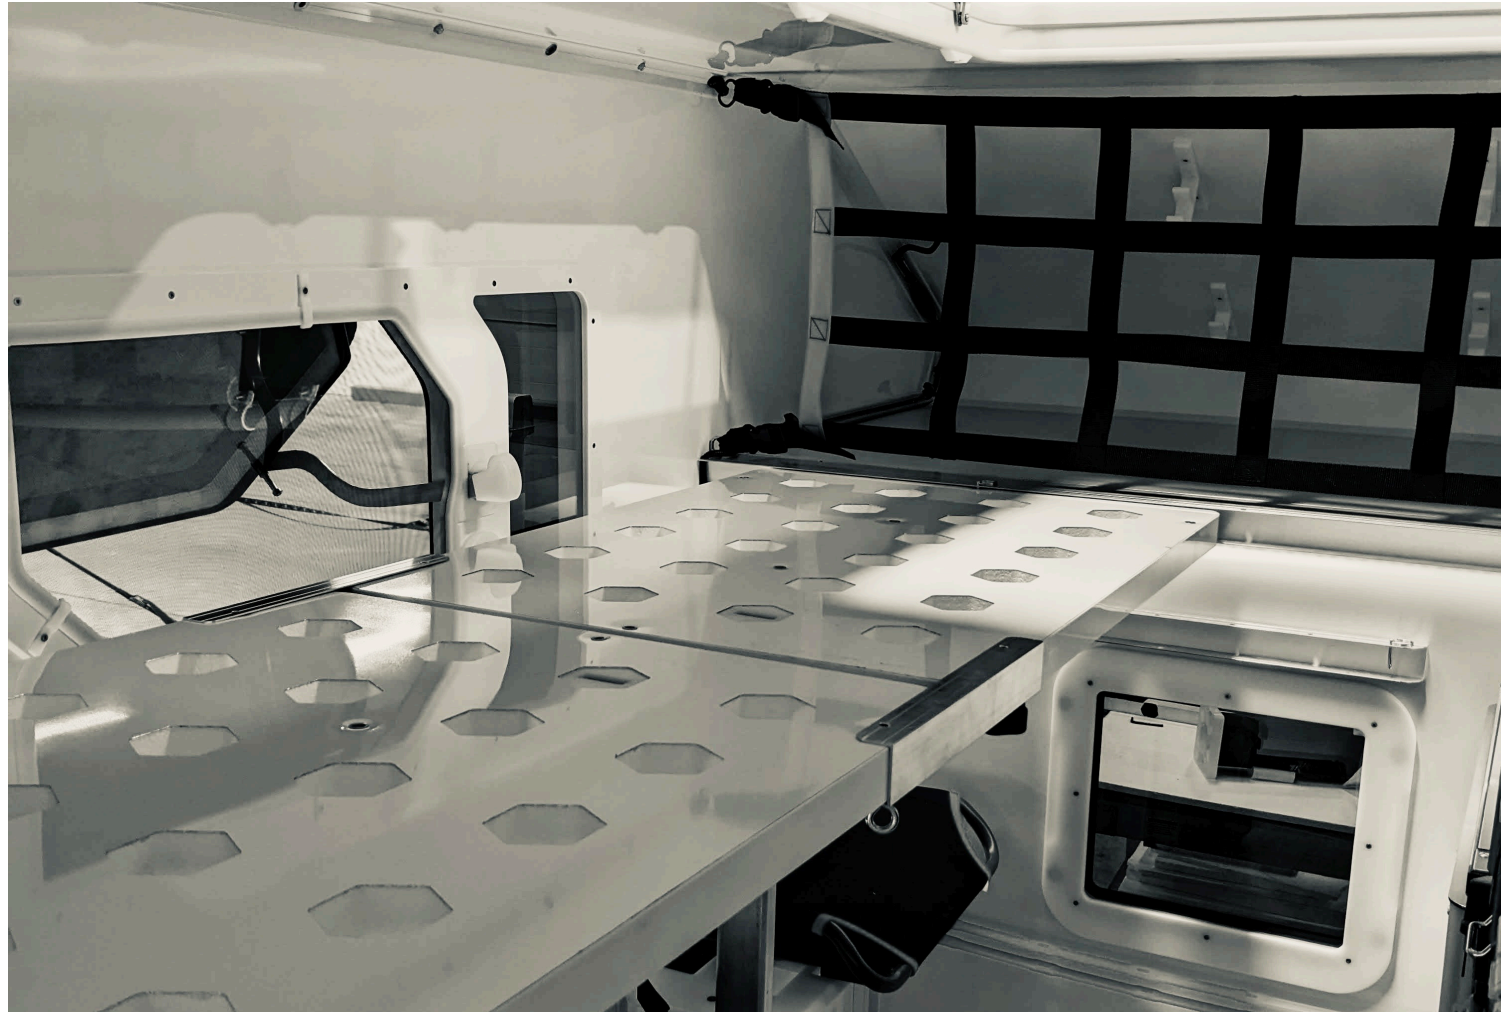

A low-angle view of the 2 panel display stretching across the interior of the camper. Storage is located along the right side for the attachable components. The left side features 2 seat locations as well as electrical box placement. This display allows for central sleeping on a 10 foot long bed, utilizing this arrangement on the left, right or central (as shown) location offers great versatility.

A closer look at the versa panels used to form the beds and tables within this camper. By simple hook lock attachments and mobile leg stands, users find complete functionality and unlimited options for sleeping/living arrangements.

A full size bed, spanning across the interior of the unit. This allows for a sleeping arrangement that can sleep 2 people comfortably. Storage can be utilized underneath the bed and in the overcab.

An interior display of life inside the camper while setting up for cooking. As shown, there is a grill, storage, sink and seating all located on the left side. This allows for the right side of the camper to function as seating and storage.

A stand alone display of our versa panel and legs set up for exterior usage. This presents how modular and multifunctional these components can be.
