Music Technology Inc. SACD/CD/DAC upgrades consist of our **SteadiClock high precision, low jitter clock and our all JFET analog signal path upgrade**. Practically all players use an abundance of opamps. No matter how “good” the opamp, they simply will never sound as good as a low or no feedback discrete circuit. The reason for this is the amount of feedback needed to control an operational amplifiers gain. This damages time coherence, which hurts image focus among other things. Hear the difference. We offer these upgrades for most players in either **balanced ($2,400)** or **unbalanced ($1,800)** configurations.
