

Powertex®

CRACKLING WITH POWERTEX IVORY AND BISTER

MATERIAL:

Powertex ivory, sponge or flat brush and/or palette knife wide Bister, hair dryer, Canvas or other carrier

1. This carrier is a styrofoam Medallion that has been modified with a knife. To prevent too much crumble of styrofoam, you can still burn with the Powertex Heat tool.
2. Apply a layer of Powertex Ivory with brush, the flat hand or a palette to Canvas or any other support. Apply the layer non-equally but in different thicknesses. The thicker the layer, the greater will be the cracks.
3. Apply a spray bottle filled with bister and spray enough on the still wet Powertex layer.
4. Turn the hair dryer on the highest and hottest stand and you see how the cracks appear. Start by drying the thinnest layers, that dry first on. If the whole dark fails you can gently wash away with a damp kitchen sponge.
5. A subtle finish you obtain by drybrushing Powertex ivory on top of the darker parts. (Brushing see PDF brusstechnieken).
