

RANGE FINDERS

Range finders are an item that has become a must in the hunting and shooting world. This equipment allows us to collect data to a target/animal instantly. Knowing the range to the target is really the first thing you need to know to a proper shot. When selecting a range finder, be sure to find one that is going to be able to range the furthest distance you are planning to shoot.

I have a rule for selecting this. Always buy a range finder that can detect 300 to 500 yards further than you plan to shoot. The reason for this, I find that most of them are most inaccurate at their closest and furthest distances. Also, the further its capabilities are, the easier it will be to acquire the target. The laser it projects must be reflected back to the unit. The longer the distance, the harder it is for the unit to read this data. Higher end models that read longer distances are set to do this much easier and efficiently.
