Introduction to Service Impact

Zenoss Service Impact provides two key functions that help you reduce the time it takes to uncover and fix issues, and to eliminate unforced outages. These functions are:

Root cause analysis identifies infrastructure dependencies that are supporting a service and how status and performance issues might be affecting the overall service.

Impact analysis identifies which services are affected by a particular piece of infrastructure.

Root cause analysis

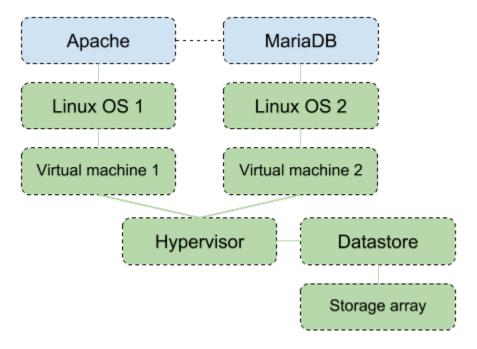

For example, consider a service we'll call Simple LAMP - a two tier web application service. The elements of the service are an Apache process serving web pages and a MariaDB database process that stores and retrieves dynamic data.

Here's a representation of Simple LAMP:

There's much more to it, of course. When we consider the infrastructure that these two applications rely on, the drawing gets more complex. The processes run on separate Linux operating systems, which might be running in virtual machines on one or more hypervisors, with backing storage provided by a storage array.

Here's a more realistic view of Simple LAMP:

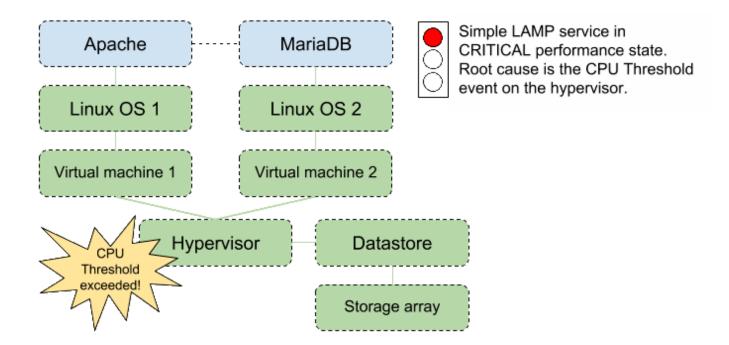

Service Impact automatically builds and maintains a model of the relationship among the service elements and their infrastructure dependencies. For the Apache and MariaDB processes, the operating systems, virtual machines, hypervisor, datastore, and storage array are all dependencies. What happens if the two virtual machines move to a new hypervisor? Or a public cloud? Service Impact automatically adjusts its model to track the proper dependencies. You don't have to make any configuration changes, as long as the new infrastructure is being monitored by Resource Manager.

If the Simple LAMP service isn't acting properly, Service Impact can help you discover where faults originate. We call this **root cause analysis**. Here's how it works.

Zenoss Resource Manager routinely collects state change data and generates threshold events where performance metrics are out of the norm. Service Impact determines which state change and threshold events apply to the Simple LAMP service—including the dependencies and generates a state for the service. Each time the state of the service changes, Service Impact generates an event that you can use to generate a service ticket, send an email, or start corrective action (see Triggers and notifications).

For example, let's pretend that the Hypervisor doesn't have enough CPU capacity to meet all the demand. Resource Manager generates a critical CPU Threshold Event for the hypervisor. Since everything in the Simple LAMP service relies on the hypervisor, Service Impact sets the state of the service to indicate that the service is in a critical performance state, and identifies the event on the hypervisor as the root cause of the event.

Here's an illustration of the hypervisor event:

Impact analysis

Impact Analysis helps teams identify whether any key services are being supported by a particular piece of infrastructure. This can prevent downtime caused by operational errors, such as forgetting to migrate virtual machines from a hypervisor before applying patches.

Once you've defined services for root cause analysis, impact analysis is performed automatically. To see which services rely on a piece of infrastructure, click on the Services view. In the following example, nine services rely on the VMware host named ucs1-3-8-zenoss.loc.

Understanding service states

Service Impact uses Resource Manager events to determine the availability and performance states of services. From highest to lowest, the availability states are Up, Degraded, At Risk, and Down. Performance states are Acceptable, Degraded, and Unacceptable.

If there are no negative Resource Manager events for the elements or dependencies of a service, then the availability state is Up and the performance state is Acceptable. The following table summarizes the default policies for negative events:

Service state type	Event class	Event severity	Service state
Availability	/Status/*	Critical	Down
	(except /Status/SNMP and /Status/WMI)	Error	Degraded
		Warning	At Risk
Performance	/Perf/*	Critical	Unacceptable
		Error	Degraded
		Warning	Degraded

Note that if an event has been generated for a component of a device (for example, a specific process), by default this event is not interpreted by Service Impact for the purposes of the device's availability or performance. In order for events related to a component to be interpreted by Service Impact, the component itself must be added to the service as an element. Administrators can identify the component that must be added by examining the component field of the event.

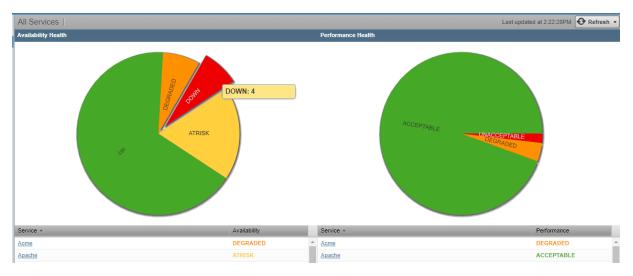

For example, assume that LinuxServerA is an element of a service called Wordpress Blog. If the HTTP process on LinuxServerA quits, a Resource Manager event is created, but Service Impact will not interpret that event for the purposes of LinuxServerA's availability or performance states, and therefore the event will not affect the availability or performance status of the Wordpress Blog service. If the administrators of Wordpress Blog decide that the HTTP process on LinuxServerA is indeed a dependency of the Wordpress Blog service, they must add the HTTP process on LinuxServerA as an element of the Wordpress Blog service Impact.

Viewing service states

You can see the current service state in multiple places. Availability and performance states are displayed in a Service Health indicator. This example service is At Risk for availability and Acceptable for performance.

Service Dashboards provide a convenient way to see the status of multiple services concurrently. To see these dashboards, select Dynamic Services or any Service Organizer under the Impact tab.

Service Impact events

When a service's availability or performance state changes, Service Impact sends an event to Resource Manager. The following table summarizes the default policies for negative state changes:

Control office Event office	Service state type	Event class	Service state	Event severity
-----------------------------	--------------------	-------------	---------------	----------------

Availability	/Service/State/Availability	Down	Critical
		Degraded	Error
		At Risk	Warning
Performance	/Service/State/Performance	Unacceptable	Critical
		Degraded	Error

You can use the triggers and notifications feature of Resource Manager to let someone know that a service has changed state, to create a service desk ticket, or to generate an automated response.

State propagation policies

State propagation policies for a dynamic service context determine how the Availability and Performance state of an entity's node and the nodes it impacts change because of events being received to that entity.

When new events occur against a service model member (device, component, component group, logical node, organizing group, or dynamic service) Service Impact identifies all of the service contexts in which that member participates. For each service context, Service Impact performs the following processing:

- Applies the combination of global, service, and node context policies to decide the state of that member in this service context.
- If the combination of policies indicate that the event should be propagated further within the service context, looks up all impact
 dependency relationships that exist for other nodes in the same service context. Different relationships can exist in other service contexts.
- Applies the service context polices to each of those nodes to compute their new state in the service context and decide whether to
 continue propagating further. Propagation of state change and event continues until all state and event propagations are completed.
- If any path through the impact graph affects the dynamic service itself, generates a service event. The service event includes details about the path from the event to the service model member through the impact graph to reach the dynamic service. Multiple paths through the graph from a single member's event might reach the dynamic service node, and multiple concurrent events to different members. Therefore, details of a service event include the union list of all service event paths and a probability ranking of which path and originating member event is the root cause.

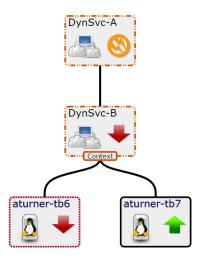

For a service model member that you use only to group child members, you can suppress sending service events.

You can create and assign multiple policies to any service member. In the Impact View, to select the type of policy that you want to create, edit, or view, select the Availability aspect or the Performance aspect.

The policy type that is applied to the members determines which members receive the data. The policy types, in order of precedence are as follows. For more information about state symbols and borders that are shown in the examples, see Actual and derived state.

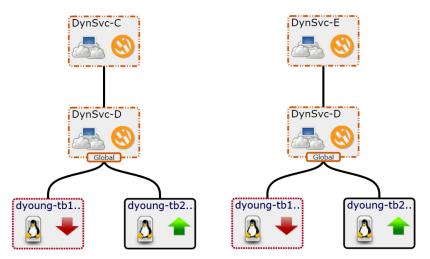

1. A contextual policy propagates the member's state change only to its immediate parent members within the current service context.

In the following example graph, a contextual policy is applied to the service model for Dynamic Service B (DynSvc-B). The policy states that if one child member is down, then the state of DynSvc-B must be degraded.

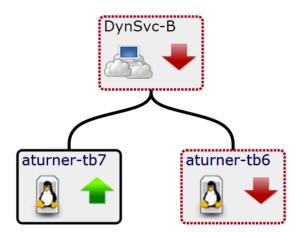

2. A global policy applies to all service model contexts that share an member that has a changed state. For example, if a global policy is applied to a member in a service model, and a child member has a change to its state data, the new state is propagated to the parent members in all service models to which the member belongs.

The following example graph shows that DynSvc-D is used in two different service models: DynSvc-C and DynSvc-E. The global policy propagates the degraded state to all service contexts of which DynSvc-D is a member.

3. A member with the default policy sends the state data of the worst condition affecting it to its parent member. The default policy is negated if you add either a contextual or global policy to a service model.

In the following example graph, no policy is applied to DynSvc-B. Its state is down because that is the worst case of its children.

If multiple policies are applied to a member, then the following overrides occur:

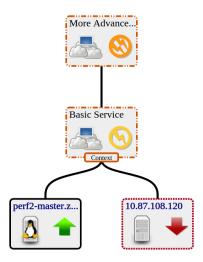

- · A contextual policy overrides a global policy.
- Contextual and global polices override the default policy.

Actual and derived state

Each in a service model has an actual state and a derived state.

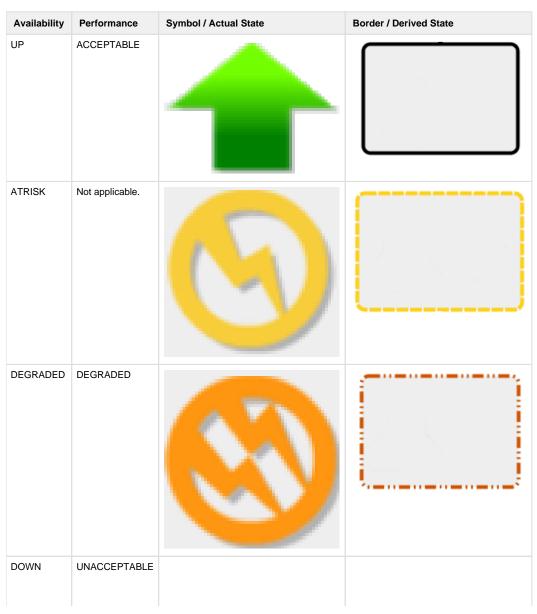

A device element's actual state is determined by events that occur on the device, regardless of the service models in which it participates. A service model member's actual state is generated from the service model in its own service context. The element's derived state is generated from policy propagation within a given context. In the Service Impact graph, the symbol that appears inside the node's border reflects the actual state; the border that outlines the node reflects the derived state.

In the following example graph, the actual and derived states are down. The parents of the device have a degraded and at-risk actual state, yet the derived state based on the contextual policy, is degraded.

Visual state indicators

The Impact View provides symbols and borders to visually indicate availability, actual state, performance, and derived state, as shown in the following table.

A member's actual and derived states can be different. As shown in the following example, a service's actual state can be up, but an applied context policy changed its derived state to down.

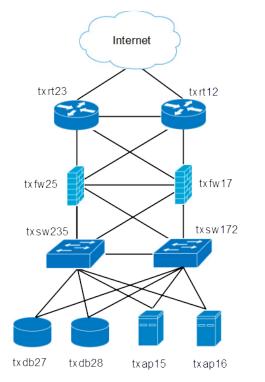

Tutorial: Creating a service model

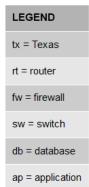

This tutorial demonstrates how to create a service model for a simplified CRM application, view the model, and view and interpret the root-cause analyses that Service Impact creates when events affect the application's availability state.

About this tutorial:

- For information about Service Impact browser interface elements, see Service Impact home page.
- Complete the tasks in the order in which they are presented.
- · Where indicated, steps depend on the version of Resource Manager with which Service Impact is deployed.
- Device and component resources for this tutorial are fake, and do not affect production environments. The final task erases the fake
 devices and the nodes that you create during the tutorial. For more information, see Tutorial devices and member types.

The following diagram shows the network topology of the CRM application that is featured in this tutorial.

Define the service to model

The service to model is a CRM application, and it is defined by the members (resources) on which it relies.

The CRM application relies on application and database hosts and processes, and on the network infrastructure that connects the service with its users. This tutorial creates a service model of the development deployment of the CRM application, not the production or quality assurance deployments.

The following procedure loads the fake devices into Resource Manager and sets up the tutorial environment.

- 1. Gain access to the Resource Manager CLI environment in a Zope container.
 - 1. Log in to the Control Center master host as a user with serviced CLI privileges.
 - 2. Start an interactive session in a Zope container as user zenoss.

```
serviced service attach zope/0 su - zenoss
```

- 2. Create a soft link to the Service Impact scripts directory.
 - 1. Create a variable for the path of the ZenPacks.zenoss.Impact ZenPack.

```
\label{eq:my_zp=sigma} $$ my_zp=$(zenpack --list | awk '/\.Impact-/ { print substr($2,2, length($2)-2) }') $$
```

2. Create the link.

```
ln -s $my_zp/ZenPacks/zenoss/Impact/scripts/tutorial ${HOME}
/impact_scripts
```

3. Change directory to the Service Impact scripts directory.

```
cd ${HOME}/impact_scripts
```

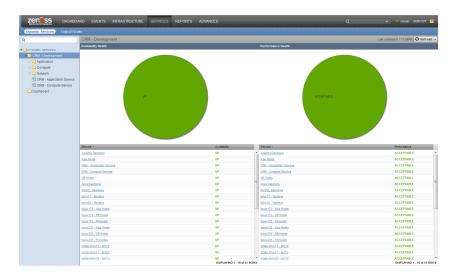

4. Load fake devices and components into Resource Manager.

zenbatchload --nomodel ./devices.txt

- 5. In tutorial.sh, ensure that the values of the ZENOSS_USERNAME and ZENOSS_PASSWORD variables specify the user name and password of a Resource Manager user account, and if not, change them.
- 6. Set up the tutorial environment.

./tutorial.sh

- 7. Log in to the Resource Manager browser interface as a user with ZenManager or Manager privileges.
- 8. Click SERVICES.
 - The Service Impact feature of Resource Manager adds a tab named SERVICES to the Resource Manager menu bar.
- 9. In the tree view, open the CRM Development organizer, and then open the Application and Compute organizers. The tree view displays the service members created by the tutorial.sh script, as shown in the following example.

Tutorial devices and member types

The tutorial uses the following fake devices and service model member types (Resource Manager device or component).

Application host 15

Device name	Description	Member type
fake-txap15	Application host 15	Device
fake-txap15-httpd	Apache daemon	Component
fake-txap15-java	Java/JRE daemon	Component
fake-txap15-nic-0	Network interface card 0	Component
fake-txap15-nic-1	Network interface card 1	Component

Application host 16

Device name	Description	Member type
fake-txap16	Application host 16	Device
fake-txap16-httpd	Apache daemon	Component
fake-txap16-java	Java/JRE daemon	Component
fake-txap16-nic-0	Network interface card 0	Component
fake-txap16-nic-1	Network interface card 1	Component

Database host 27

Device name	Description	Member type
fake-txdb27	Database host 27	Device
fake-txdb27-mysqld	MySQL daemon	Component
fake-txdb27-nic-0	Network interface card 0	Component
fake-txdb27-nic-1	Network interface card 1	Component

Database host 28

Device name	Description	Member type
fake-txdb28	Database host 28	Device
fake-txdb28-mysqld	MySQL daemon	Component
fake-txdb28-nic-0	Network interface card 0	Component
fake-txdb28-nic-1	Network interface card 1	Component

Firewall 17

Device name	Description	Member type
fake-txfw17	Firewall 17	Device
fake-txfw17-10g-0	Port 0 (10GB capacity)	Component
fake-txfw17-10g-1	Port 1 (10GB capacity)	Component
fake-txfw17-10g-2	Port 2 (10GB capacity)	Component
fake-txfw17-10g-3	Port 3 (10GB capacity)	Component
fake-txfw17-1g-0	Port 0 (1 GB capacity)	Component

Firewall 25

Device name	Description	Member type
fake-txfw25	Firewall 25	Device
fake-txfw25-10g-0	Port 0 (10GB capacity)	Component
fake-txfw25-10g-1	Port 1 (10GB capacity)	Component
fake-txfw25-10g-2	Port 2 (10GB capacity)	Component
fake-txfw25-10g-3	Port 3 (10GB capacity)	Component
fake-txfw25-1g-0	Port 0 (1 GB capacity)	Component

Router 12

Device name	Description	Member type
fake-txrt12	Router 12	Device
fake-txrt12-100g-0	Port 0 (100GB capacity)	Component
fake-txrt12-10g-0	Port 0 (10GB capacity)	Component
fake-txrt12-10g-1	Port 1 (10GB capacity)	Component
fake-txrt12-1g-0	Port 0 (1GB capacity)	Component

Router 23

Device name	Description	Member type
fake-txrt23	Router 23	Device
fake-txrt23-100g-0	Port 0 (100GB capacity)	Component
fake-txrt23-10g-0	Port 0 (10GB capacity)	Component
fake-txrt23-10g-1	Port 1 (10GB capacity)	Component
fake-txrt23-1g-0	Port 0 (1GB capacity)	Component

Switch 172

Device name	Description	Member type
fake-txsw172	Switch 172	Device
fake-txsw172-10g-0	Port 0 (10GB capacity)	Component
fake-txsw172-10g-1	Port 1 (10GB capacity)	Component
fake-txsw172-1g-0	Port 0 (1GB capacity)	Component
fake-txsw172-1g-1	Port 1 (1GB capacity)	Component
fake-txsw172-1g-2	Port 2 (1GB capacity)	Component
fake-txsw172-1g-3	Port 3 (1GB capacity)	Component
fake-txsw172-1g-4	Port 4 (1GB capacity)	Component

Switch 235

Device name	Description	Member type
fake-txsw235	Switch 235	Device
fake-txsw235-10g-0	Port 0 (10GB capacity)	Component
fake-txsw235-10g-1	Port 1 (10GB capacity)	Component
fake-txsw235-1g-0	Port 0 (1GB capacity)	Component
fake-txsw235-1g-1	Port 1 (1GB capacity)	Component
fake-txsw235-1g-2	Port 2 (1GB capacity)	Component
fake-txsw235-1g-3	Port 3 (1GB capacity)	Component
fake-txsw235-1g-4	Port 4 (1GB capacity)	Component

Introduction to the tutorial environment

The tutorial.sh script creates the following service model members and organizers to initialize the CRM service model in Service Impact. Use of these members and organizers is a recommended best practice.

- · Dashboard organizer; root-level organizer for service models as a whole. Initially, the organizer is empty.
- Root-level CRM Development organizer that contains additional organizers. Use a single root-level organizer to contain the subservices
 of each service model, and use standardized names (and contents) for sub-organizers.
- CRM Application Service and CRM Compute Service service model members, children of the CRM Development organizer.

These members summarize the application and compute services that are associated with the CRM application. They are easily located without having to open the organizers in which their constituent subservices are located.

Members in the Network organizer that start with zfake represent the network connections between fake devices.

Because these fake devices are not modeled, Resource Manager cannot discern their relationships, and Service Impact cannot create device or component members. Therefore, the script creates members to represent the connections.

These members have neither contextual nor global policies, so the default policy applies. That is, the state of the worst condition that affects child members becomes the state of the zfake members, which is the correct policy for these connections.

DNS and interface names that follow a naming convention.

Subservice members in the Network organizer that start with tx, which contain redundant resources. Standardized, global availability
policies are defined.

These subservice members demonstrate the following best practices:

- Each subservice member contains homogeneous child members. Global policies work best when child members are homogeneous.
- Each subservice uses global policies. Global policies can be re-used across service model boundaries. Contextual policies are restricted to specific service models.
- Each global policy contains the following, standardized availability state triggers: ATRISK if 50% or more child members are
 down; DOWN if 100% of child members are down. Use of percentage thresholds means that the policies do not need to be
 adjusted if additional resources are deployed later. Note: The standardized state triggers that are used in this case are examples
 of systematically thinking about and using global policies, and not intrinsically best practices. For example, if a resource pool
 contains more than two members, additional state triggers can be defined.

The remaining procedures in this tutorial demonstrate how to complete and test the CRM service model.

Create logical node and subservice members for Internet connections

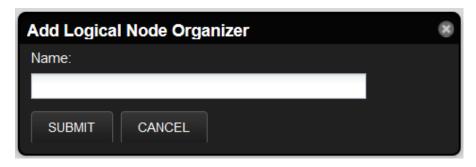

All network connections except the connection to the Internet are modeled. Because the Internet connection is not modeled in Resource Manager, we create a logical node to represent it. For this tutorial, the logical node is simply a service model member that reacts to fake events. A "real" logical node could be configured to react to events from a zencommand that pings an Internet resource.

- · Create logical node
- Create a subservice member for one Internet connection
- Create a subservice member for the other Internet connection
- · Create service member to represent redundant paths to the Internet
- Add a policy to the Internet connection member

Create logical node

Follow these steps:

- 1. In the Resource Manager browser interface, select SERVICES > Logical Nodes.
- 2. From the Add menu at the bottom of the tree view, select Add Logical Node Organizer.

- 3. In the Add Logical Node Organizer dialog box, enter CRM Development, and then click SUBMIT.
- 4. From the Add menu at the bottom of the tree view, select Add Logical Node.
- 5. In the Add Logical Node dialog box, enter example.com, and then click SUBMIT.
- 6. In the example.com details view, enter values to match the following table, and then click Save.

Field	Description
Description	A node to help represent a route to the Internet.
Criteria	all, Summary, contains, fakeInternet
Events for this node in this event class	/Status/Ping
will result in these availability states	Critical: DOWN, Error: DOWN, Warning: ATRISK, Clear: UP

Create a subservice member for one Internet connection

Create a service model member for the connection from router 12 to the zenoss.com logical node.

- 1. In the Resource Manager browser interface, select SERVICES > Dynamic Services.
- In the tree view of organizers, open CRM Development > Network.
 Unless an organizer is selected, new members are created at the root level. From there, you can drag the new member into the correct organizer.
- 3. From the Add menu at the bottom of the tree view, select Add Dynamic Service.
- 4. In the Add Dynamic Service dialog box, enter txrt12 Internet, and then click SUBMIT.

- 5. In the Members view, click Add.
- 6. In the Add to Service search field, enter fake-txrt12.

- 7. In the left column, select Device, and in the results list, select fake-txrt12-100g-0, and then click ADD.
- 8. In the search field, enter example.com.
- 9. From the search results list, select example.com, and then click ADD > CLOSE.

Create a subservice member for the other Internet connection

To create the service model member for the connection through router 23, clone the member for the connection through router 12.

- 1. In the tree view, select service model member txrt12 Internet.
- 2. From the Action menu at the bottom of the tree view, select Clone Service.
- 3. In the Clone Service dialog box, enter txrt23 Internet, and then click SUBMIT. The new service is created and its contents are displayed in the Members view.
- 4. From the list of members in the Members view, select fake-txrt12-100g-0, and then click Remove.

 If you click on the name of the member, Resource Manager displays the device overview page. To return to the correct page, click the browser's back button.
- 5. In the Remove Items dialog box, click OK.
- 6. In the Members view, click Add.
- 7. In the Add to Service search field, enter 100g.
- 8. In the left column, select Device.
- 9. In the results list, double-click fake-txrt23-100g-0, and then click ADD > CLOSE.

Create service member to represent redundant paths to the Internet

The previous tasks created subservices to represent the WAN connections to the Internet. This task creates a subservice member in the service model to represent the redundant WAN tier.

- 1. In the tree view, select Network.
- 2. From the Add menu, select Add Dynamic Service.
- 3. In the Add Dynamic Service dialog box, enter Routers Internet, and then click SUBMIT.
- 4. In the Members view, click Add.
- 5. In the Add to Service search field, enter Internet.
- 6. In the left column, select DynamicService.
- 7. In the results list, select txrt12-Internet and txrt23-Internet, and then click ADD > CLOSE.

Add a policy to the Internet connection member

Add a global availability policy to the Internet connection subservice member.

- 1. In the tree view, select Routers Internet.
- 2. From the view menu, select Impact View.
- 3. In the node tile of the Routers Internet service (the tile at the top of the hierarchy), right-click and then select Edit Impact Policies.
- 4. In the Impact Policies dialog box, directly to the right of the Global Policy entry, click Add.

5. In the lower-left corner of the Edit...Policy tab, click Add, and then add the following triggers.

- ATRISK if >= 50% DynamicService is DOWN
- DOWN if >= 100% DynamicService is DOWN

When you select a type for a state trigger, the selection excludes other types. In this case, the only options are Any and Dynam icService, and both child members are service members, so exclusivity is not a concern.

Create members for major network segments

All connections between devices and all redundant resources are modeled. This procedure creates service model members for the major network segments.

- 1. In the Resource Manager browser interface, select SERVICES > Dynamic Services.
- 2. In the tree view, open CRM Development > Network.
- Create new members for the major network segments. For instructions, see preceding steps. The following table shows new and existing members.

New service model member	Existing service model members
App Hosts - Switches	txsw235 - App Hosts, txsw172 - App Hosts
DB Hosts - Switches	txsw235 - DB Hosts, txsw172 - DB Hosts
Firewalls - Routers	txfw25 - Routers, txfw17 - Routers
Switches - Firewalls	txsw235 - Firewalls, txsw172 - Firewalls

- 4. Add the following global policies (availability state triggers) to each new service model member. For instructions, see preceding steps.
 - ATRISK if >= 50% DynamicService is DOWN
 - DOWN if >= 100% DynamicService is DOWN

Create summary members for critical paths

Service model members for all of the major network segments are in place. Now consider members to represent the critical paths. To characterize the CRM application as available, the following minimum connections are required:

- One connection between Internet users and an application server that is UP.
- One connection between an application server and a database server that is UP.

If entities for these paths existed, we could create the service model member that summarizes the network service for CRM. However, only one segment is defined, by the Routers - Internet subservice. The following paths require an additional subservice each:

- The path between the routers and the application hosts.
- The path between the application and database hosts.
- 1. In the Resource Manager browser interface, select SERVICES > Dynamic Services.
- 2. In the tree view, open the CRM Development organizer, and then open and select the Network organizer.
- Create new service model members for the network paths that affect users.
 Because each subservice is critical, the correct policy for these new service model members is the default policy. The following table matches new and existing service model members.

New service model member	Existing service model members
Routers - App Hosts	App Hosts - Switches, Firewalls - Routers, Switches - Firewalls
App Hosts - DB Hosts	App Hosts - Switches, DB Hosts - Switches

For detailed instructions, see the preceding steps.

Create a member for the network service

The critical network paths are defined. Create a service model member to represent the network service for the CRM application.

- 1. In the Resource Manager browser interface, select SERVICES > Dynamic Services.
- In the tree view, open the CRM Development organizer, and then select it.Service model members that represent a category should be peers of their sub-organizers.
- 3. Create a new service model member, named CRM Network Service.
- 4. Add the following subservice model members to the new service model member.
 - App Hosts DB Hosts
 - Routers App Hosts
 - Routers Internet

The correct policy for this member is the default policy.

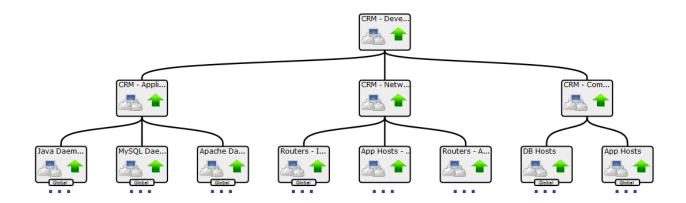

Create a member for the service model

After all resource categories are modeled, the application as a whole can be modeled.

- 1. In the Resource Manager browser interface, select SERVICES > Dynamic Services.
- 2. In the tree view, select the Dashboard organizer.

 Keep service model members that represent a service model as a whole in a separate, root-level organizer. This way, you can quickly determine the state of all service models in the environment.
- 3. Create a service model member named CRM Development Service and add the following subservice model members to it.
 - CRM Application Service
 - CRM Compute Service
 - CRM Network Service

To view the graph of the service model, select the new service in the tree view, and then select Impact View. After hiding child nodes and zooming in, the graph looks similar to the following image. If necessary, to reposition the graph, click and drag it.

Send events to fake devices

To see how they affect the availability of the CRM application, send events to the fake devices.

- 1. In the tree view, open the Dashboard organizer, and then select CRM Development Service.
- 2. In the main view area, select Impact View.
- 3. Gain access to the Resource Manager CLI environment in the ZenHub container.
 - 1. Log in to the Control Center master host as a user with serviced CLI privileges.
 - 2. Start an interactive session in a Zope container as the zenoss user.

serviced service attach zenhub su - zenoss

4. Send ping down events to the fake network interface card components in the txap15 and txap16 hosts.

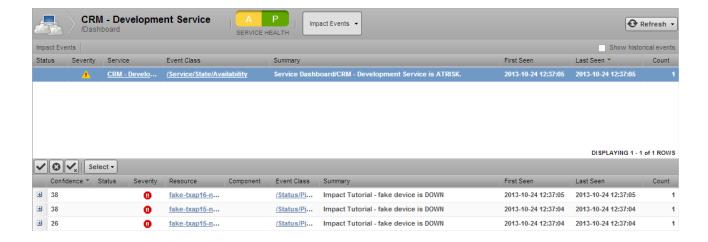

```
zensendevent -d fake-txap15-nic-0 -c /Status/Ping -s Critical "Impact
Tutorial - fake device is DOWN"
zensendevent -d fake-txap15-nic-1 -c /Status/Ping -s Critical "Impact
Tutorial - fake device is DOWN"
zensendevent -d fake-txap16-nic-0 -c /Status/Ping -s Critical "Impact
Tutorial - fake device is DOWN"
```

5. In the browser, click Refresh.

The Impact View shows that the CRM application availability state changed to ATRISK, and the nodes involved in the state change are highlighted with yellow and red.

To see all nodes in the Service Impact graph, click Expand All.

6. Change the view to Impact Events, and then in the Impact Events list, click CRM - Development Service.

The events that contribute to the current state of the CRM application are weighted by the root-cause analysis that Service Impact performs (the Confidence column). To view the impact chain of an event, click the plus button in the left column.

7. Send ping down events to the fake network interface card components in the txdb27 and txdb28 hosts, and then click Refresh.

```
zensendevent -d fake-txdb27-nic-0 -c /Status/Ping -s Critical "Impact Tutorial - fake device is DOWN"
zensendevent -d fake-txdb27-nic-1 -c /Status/Ping -s Critical "Impact Tutorial - fake device is DOWN"
zensendevent -d fake-txdb28-nic-0 -c /Status/Ping -s Critical "Impact Tutorial - fake device is DOWN"
```

The list of contributing events grows, and the rankings change to reflect the added events.

8. Send clear events to all fake devices that are down.

```
zensendevent -d fake-txap15-nic-0 -c /Status/Ping -s Clear "Impact Tutorial - fake device is UP"

zensendevent -d fake-txap15-nic-1 -c /Status/Ping -s Clear "Impact Tutorial - fake device is UP"

zensendevent -d fake-txap16-nic-0 -c /Status/Ping -s Clear "Impact Tutorial - fake device is UP"

zensendevent -d fake-txdb27-nic-0 -c /Status/Ping -s Clear "Impact Tutorial - fake device is UP"

zensendevent -d fake-txdb27-nic-1 -c /Status/Ping -s Clear "Impact Tutorial - fake device is UP"

zensendevent -d fake-txdb28-nic-0 -c /Status/Ping -s Clear "Impact Tutorial - fake device is UP"

zensendevent -d fake-txdb28-nic-0 -c /Status/Ping -s Clear "Impact Tutorial - fake device is UP"
```

Remove tutorial service model members

This step removes all tutorial-defined members.

- 1. Log in to the Resource Manager browser interface as a user with ZenManager or Manager privileges.
- 2. Click SERVICES.
- 3. Remove the dynamic services and logical node.
 - 1. In the tree view, select the Dashboard organizer.
 - 2. At the bottom of the tree view, click Delete.
 - 3. In the tree view, select CRM Development.
 - 4. At the bottom of the tree view, click Delete.
 - 5. Select the Logical Nodes view mode.
 - 6. In the tree view, select CRM Development.
 - 7. At the bottom of the tree view, click Delete.
- 4. Remove the fake devices.

- 1. In the Resource Manager browser interface, select INFRASTRUCTURE.
- 2. In the tree view, select FakeImpactDevices.
- 3. At the bottom of the tree view, click Delete.

Administering Service Impact

This section includes administration procedures.

- Installing or updating Service Impact
- Exporting service models from one system to another
- Adding an Impact Services portlet
- Production state propagation threshold
- Service Impact server configuration files
- Targeted graph update
- Removing Service Impact
- Service Impact MIB file
- Dynamic service name restrictions

Installing or updating Service Impact

Service Impact is packaged as a Docker image and two ZenPacks (ZenPacks.zenoss.Impact and ZenPacks.zenoss.ImpactServer). The files are available from delivery.zenoss.com. The ZenPacks require a customized installation procedure, which is documented in this section.

The Impact service includes the Service Impact server and database. The install process adds the service to the Infrastructure hierarchy in Control Center. Its requirements are minimal, compared to the other services in that hierarchy. The resource pool you select for the Infrastructure hierarchy easily accommodates the Impact service.

The zenimpactstate service includes the zenimpactstate daemon. In Control Center, the service is included in the Events category of the Zenoss hierarchy.

Once Service Impact is installed, Resource Manager is dependent on it. If Service Impact services are unavailable, Resource Manager continues to monitor devices, but is unable to perform modeling, or properly install or remove ZenPacks.

- Installing Service Impact
- Updating Service Impact

Installing Service Impact

Before performing this procedure, complete the steps in Preparing to install or update Service Impact.

- 1. Log in to the Control Center master host as a user with Control Center CLI privileges.
- 2. Create a snapshot:

serviced service snapshot Zenoss.resmgr

On completion, the serviced command returns the ID of the new snapshot. If the installation of a ZenPack fails, you can restore the snapshot created in this step. For more information about restoring a snapshot, see Creating snapshots and rolling back.

- 3. Stop the Zenoss services, and then verify that the services are stopped.
 - 1. Stop Resource Manager.

serviced service stop Zenoss.resmgr/Zenoss

Wait until all services are stopped.

Use the ${\tt watch}$ command to monitor the status.

watch serviced service status Zenoss.resmgr/Zenoss

- 4. Install the ZenPacks.zenoss.ImpactServer ZenPack.
 - 1. Change directory to the directory in which the Service Impact ZenPack egg files are located. For example, the /tmp/impact directory:

cd /tmp/impact 2. Install the ZenPack. Replace VERS/ON with the ZenPack version number: serviced service run zope zenpack-manager install ZenPacks. zenoss.ImpactServer-VERSION-py2.7.egg 5. Start the Infrastructure/Impact service, and then verify that it started. Start the Impact service. serviced service start Infrastructure/Impact 2. Verify that the service is started. watch serviced service status Infrastructure/Impact 6. Start required Zenoss services. Start the zeneventserver and Zope services. serviced service start zeneventserver zope 2. Wait until the services are started. Use the watch command to monitor the status. watch serviced service status zeneventserver zope 7. Install the ZenPacks.zenoss.Impact ZenPack. Replace VERS/ON with the ZenPack version number: serviced service run zope zenpack-manager install ZenPacks.zenoss. Impact-VERSION-py2.7.egg 8. Identify the delegate hosts where Resource Manager is running. serviced host list --show-fields=Pool, Name The name of the resource pool where Resource Manager is running is not standardized. 9. Log in to a delegate host, and then start a Zope container. 1. Log in to a delegate host in the Resource Manager pool as root or as a user with serviced CLI privileges. 2. Start a Zope container on the host. serviced service shell zope

3. In the container, log in as user zenoss.

su - zenoss

L.....

- 10. Update the catalog and then initialize the server.
 - 1. Update the catalog.

zenimpactgraph run -x catclean

2. Initialize the Service Impact server (Neo4j) database.

zenimpactgraph run --update

Processing may appear stuck for tens of minutes as connected objects are found in the ZODB. This is normal.

If the graph update fails, build the graph in batches. For more information, see Building the graph in batches.

3. Exit the zenoss user account.

exit

4. Exit the Zope container.

exit

11. Restart all Zenoss services:

serviced service restart Zenoss.resmgr/Zenoss

Preparing to install or update Service Impact

This section describes how to prepare to install or update Service Impact, and provides instructions for downloading and staging required software.

The following list outlines recommended best practices for installing or upgrading Service Impact:

- · Review the release notes for this release before proceeding. The latest information is provided there.
- Use screen, tmux, or a similar program to establish sessions on the master host. If you become disconnected, the commands you initiate will continue to run.
- Review the procedures in this section before performing them. Every effort is made to avoid mistakes and anticipate needs; nevertheless, the instructions may be incorrect or inadequate for some requirements or environments.

Downloading required files

To perform this procedure, you need:

- · A workstation with internet access.
- · Permission to download files from delivery.zenoss.com. To request permission, file a ticket at the Zenoss Support site.
- The names of the files to download. The files are listed in the release notes.
- A secure network copy program.

Follow these steps:

- In a web browser, navigate to the download site, and then log in. The download site is delivery.zenoss.com.
- 2. Download the Docker image file for Service Impact.
 - install-zenoss-impact_VERSION.run

Replace Version with the most recent version number available on the download page.

3. Download the Service Impact ZenPack files.

- ZenPacks.zenoss.ImpactServer-VERSION-py2.7.egg
- ZenPacks.zenoss.Impact-VERSION-py2.7.egg

Replace Version with the most recent version number available on the download page.

4. Use a secure copy program to copy the Docker image file and the ZenPack files to the Control Center master host.

Staging required files on the master host

To perform this procedure, you need permission to log in to the Control Center master host as root, or as a user with superuser privileges. Use this procedure to install the Docker image and to prepare the ZenPack files for installation.

- 1. Log in to the Control Center master host as root, or as a user with superuser privileges.
- 2. Stage the Docker image file and ZenPack files in /tmp.
 - 1. Create a directory in /tmp for the files. The directory must be local (not mounted) and must be readable, writable, and executable by all users. For example, /tmp/impact.

mkdir /tmp/impact

- 2. Copy or move the Docker image file and ZenPack files to /tmp/impact.
- 3. Change the file permissions. The files must have the same permissions as their parent directory.

chmod -R 777 /tmp/impact

- 3. Install the Service Impact image.
 - 1. Change to the directory in which the Service Impact image is located.

cd /tmp/impact

2. Install the image.

yes | ./install-zenoss-impact_*.run

Like

Updating Service Impact

For optimum results, review update procedures before performing an update.

Keep this page open, and open new tabs or windows for each update procedure.

Updating 5.1.x, 5.2.x, or 5.3.x to 5.4.8

Use the following procedures to update Service Impact from a previous minor release to release 5.4.x.

Perform these procedures during a scheduled maintenance window.

To update, perform these procedures:

- 1. Prepare to update
- 2. Export all dynamic services
- 3. Download and stage packages
- 4. Remove the previous version
- 5. Install Service Impact packages

Integrate Service Impact and Resource Manager

Updating 5.4.x to 5.4.8

Choose one of the following update paths to update Service Impact 5.4.x to 5.4.8. The path to choose depends on what is required for a given release. For more information, see the release notes.

Before performing an update:

- Verify that Resource Manager is running normally. The procedures in this section stop, start, or restart specific services, but the assumed starting point is Resource Manager running normally.
- Export service models. As a best practice, exporting before an update provides a quick
 restore option if the update fails. If necessary, you can uninstall, remove the ZenPack,
 install again with the working version, and then import from the exported graph. More
 information: Exporting service models from one system to another.

Use only one of the update paths in the following columns.

Updating both ZenPacks

- 1. Prepare to update
- 2. Update both ZenPacks

Updating only ZenPacks.zenoss.ImpactServer

- 1. Prepare to update
- 2. Update the ZenPack

Updating only ZenPacks.zenoss.Impact

- 1. Prepare to update
- 2. Update the ZenPack

Updating both Service Impact ZenPacks

Before performing this procedure, complete prerequisites listed in Updating Service Impact.

Perform this procedure to update both Zenpacks, ZenPacks.zenoss.Impact and ZenPacks.zenoss.ImpactServer.

- 1. Log in to the Control Center browser interface.
- 2. In the Application column of the Applications table, click Resource Manager.
- 3. Scroll down to the Services table, and then locate the Impact service in the Infrastructure section.
- 4. Click Impact, and then locate the State Change Queue Length graph.
- 5. Log in to the Control Center master host as a user with serviced CLI privileges.
- 6. Stop the zenimpactstate service, and then verify that it stopped.
 - 1. Stop the zenimpactstate service.

serviced service stop zenimpactstate

2. Verify that the service is stopped.

watch serviced service status zenimpactstate

- 7. In the Control Center browser interface, monitor the length of the state change queue. When the queue length is 0 (zero), proceed to the next step.
- 8. Stop the Infrastructure/Impact service, and then verify that it stopped.
 - 1. Stop the Infrastructure/Impact service.

serviced service stop Infrastructure/Impact

2. Verify that the service is stopped.

watch serviced service status Infrastructure/Impact

9. Extract the upgrade script from the ZenPacks.zenoss.ImpactServer ZenPack, make the script executable, and start the upgrade script.

1. Change to the directory in which the Service Impact ZenPack egg file is located.

For example, the /tmp/impact directory:

cd /tmp/impact

2. Extract the upgrade script from the ZenPacks.zenoss.ImpactServer egg file. Replace Version with the ZenPack version number:

unzip -p ZenPacks.zenoss.ImpactServer-Version-py2.7.egg \
 ZenPacks/zenoss/ImpactServer/upgrade/upgrade.sh > upgrade.sh

3. Make the script executable.

chmod +x upgrade.sh

4. Start the upgrade script.

./upgrade.sh

Note: The upgrade script might display CRITICAL warning messages, which can be ignored.

- 10. Start the Infrastructure/Impact service, and then verify that it started.
 - 1. Start the Infrastructure/Impact service.

serviced service start Infrastructure/Impact

2. Verify that the service is started.

watch serviced service status Infrastructure/Impact

11. Install the ZenPacks.zenoss.Impact ZenPack

Replace Version with the ZenPack version number:

serviced service run zope zenpack-manager install \ ZenPacks.zenoss.Impact-Version-py2.7.egg

12. Restart Zenoss services.

serviced service restart Zenoss.resmgr/Zenoss

Alternatively, restart the Zenoss services by using the Control Center browser interface.

Updating only ZenPacks.zenoss.ImpactServer

Before performing this procedure, complete prerequisites listed in Updating Service Impact. Perform this procedure to upgrade only the ZenPacks.zenoss.ImpactServer ZenPack.

- 1. Log in to the Control Center browser interface.
- 2. In the Application column of the Applications table, click Resource Manager.
- 3. Scroll down to the Services table, and then locate the Impact service in the Infrastructure section.
- 4. Click Impact, and then locate the State Change Queue Length graph.
- 5. Log in to the Control Center master host as a user with serviced CLI privileges.

6.		impactstate service, and then verify that it stopped.
	1. Stop	serviced service stop zenimpactstate
	2 . Vari	full that the consider is storaged

		watch serviced service status Infrastructure/Impact
	Log in to the Restart Zeno	Control Center browser interface.
۷.	ivesiaii Zenc	ss services.

.....

serviced service restart Zenoss.resmgr/Zenoss

Alternatively, restart the Zenoss services by using the Control Center browser interface.

Updating only ZenPacks.zenoss.Impact

Before performing this procedure, complete prerequisites listed in Updating Service Impact. This procedure describes how to update only the ZenPacks.zenoss.Impact ZenPack.

- 1. Log in to the Control Center master host as a user with Control Center CLI privileges.
- 2. Create a snapshot:

serviced service snapshot Zenoss.resmgr

On completion, the serviced command returns the ID of the new snapshot. If the installation of a ZenPack fails, you can restore the snapshot created in this step. For more information about restoring a snapshot, see Creating snapshots and rolling back.

- 3. Stop the zenimpactstate service, and then verify that it stopped.
 - 1. Stop the zenimpactstate service.

serviced service stop zenimpactstate

2. Verify that the service is stopped.

watch serviced service status zenimpactstate

4. Install the ZenPacks.zenoss.Impact ZenPack

Replace Version with the ZenPack version number:

serviced service run zope zenpack-manager install \ ZenPacks.zenoss.Impact-Version-py2.7.egg

- 5. Start the zenimpactstate service, and then verify that it stopped.
 - 1. Start the zenimpactstate service.

serviced service start zenimpactstate

2. Verify that the service is started.

watch serviced service status zenimpactstate

Integrating Service Impact and Resource Manager

Before performing this procedure, perform all of the previous update procedures. For more information, see Updating Service Impact.

- 1. Identify the delegate host where the zenimpactstate container is running, and the ID of the container.
 - 1. Log in to the Control Center master host as a user with serviced CLI privileges.
 - 2. Display the hostname where the container is running.

serviced service status zenimpactstate --show-fields=Name, Hostname

2. On your workstation, copy the GraphML file exported previously to a temporary directory on the delegate host identified in step 1.

- 3. Log in to the delegate host as root or as a user with superuser privileges.
- 4. Display the ID of the container in which the zenimpactstate service is running.

```
docker ps -aqf "name=$(serviced service list | awk '/zenimpactstate/
{ print $2}')"
```

- 5. Copy the GraphML file from the delegate host to a directory inside the zenimpactstate container.
 - Copy the file to the /tmp directory inside the container.
 Replace MyExportFile with the name of your GraphML file, and replace ContainerID with the result of the docker command in step 4:

```
docker cp /tmp/MyExportFile.graphml ContainerID:/tmp
```

2. Log in to the zenimpactstate container as root.

```
serviced service attach zenimpactstate
```

3. Move the GraphML file the zenoss user HOME directory and change its owner and group.

```
mv /tmp/MyExportFile.graphml /home/zenoss
chown zenoss:zenoss /home/zenoss/MyExportFile.graphml
```

4. Switch user to zenoss.

```
su - zenoss
```

- Import of the GraphML file into Service Impact.
 For detailed information about importing the file, see Importing service model definitions. The following substeps provide an outline of the procedures.
 - 1. Initiate the import.

```
zenimpactimport ./MyExportFile.graphml | tee reconcile.file
```

- 2. Reconcile entities as necessary.
 - For more information, see Reconciling originating and target system entities.
- 3. Commit the reconciled entities.

```
zenimpactimport -r ./reconcile.file --commit ./MyExportFile.
graphml 2>&1 | tee error.out
```

Installing Service Impact 5.4.x packages

Before performing this procedure, remove the previous version. For more information, see Updating Service Impact.

Perform these steps:

- 1. Log in to the Control Center master host as root or as a user with superuser privileges.
- 2. Rename the Service Impact database file.
 - 1. Display the Control Center tenant identifier.

ls /opt/serviced/var/volumes

The result should be one 24-character string. If the result is more then one string, please contact Zenoss Support.

2. Rename the database file.

Replace Tenant-ID with the result from the previous command.

mv /opt/serviced/var/volumes/Tenant-ID/impact/db /opt/serviced
/var/volumes/Tenant-ID/impact/db.pre-5.4.x

- 3. Install the new Service Impact image.
 - 1. Change to the directory in which the Service Impact image is located.

cd /tmp/impact

2. Install the image.

yes | ./install-zenoss-impact_*.run

Install the ZenPacks.zenoss.ImpactServer ZenPack.
 Replace VERS/ON with the ZenPack version number:

serviced service run zope zenpack-manager install ZenPacks.zenoss. ImpactServer-VERSION-py2.7.egg

- 5. Start the Impact service, and then verify that it started.
 - 1. Start the Impact service.

serviced service start Infrastructure/Impact

2. Verify that the service is started.

watch serviced service status Infrastructure/Impact

Install the ZenPacks.zenoss.Impact ZenPack.
 Replace VERSION with the ZenPack version number:

serviced service run zope zenpack-manager install ZenPacks.zenoss. Impact-VERSION-py2.7.egg

7. Identify the delegate hosts where Resource Manager is running.

serviced host list --show-fields=Pool, Name

The name of the resource pool where Resource Manager is running is not standardized.

1.	o a delegate host, and then start a Zope container. Log in to a delegate host in the Resource Manager pool as root or as a user with serviced CLI privileges. Start a Zope container on the host.
	serviced service shell zope
3.	In the container, log in as user zenoss.
	su - zenoss
	the catalog and then initialize the server. Update the catalog.
	zenimpactgraph run -x catclean
2.	Initialize the Service Impact server (Neo4j) database.
	zenimpactgraph runupdate
	Processing may appear stuck for tens of minutes as connected objects are found in the ZODB. This is normal.
	If the update fails, build the graph in batches. For more information, see Building the graph in batches.
3.	Exit the zenoss user account.
	exit
4.	Exit the Zope container.
	exit
10. Rename	e dynamic services and organizers, if necessary.
	zenimpactgraph run -x change_nodes_ids
	ipt checks for characters that are not allowed in names and replaces them. Changes are reported as they are made. all Zenoss services:
	serviced service restart Zenoss.resmgr/Zenoss
12. Refresh	the reverse proxy cache:
	serviced service restart Zenoss.resmgrauto-launch=False

13. Refresh the cache in your browser. The procedure varies by browser.

Building the graph in batches

The zenimpactgraph command processes nodes in parallel and uses as much memory as it can. For very large graph databases, this strategy may exhaust the available resources and fail. Use this procedure to build the graph database in batches.

Follow these steps immediately after zenimpactgraph run --update fails:

1. Remove unfinished update records:

```
zenimpactgraph run -x clear
```

2. Process the first batch of nodes with a limit of 6 worker processes:

```
zenimpactgraph run -x build --workers=6 --with-start=0 --with-
limit=100000
```

3. Process additional batches until the total number of batches is processed:

For each batch, add 100000 to the value of the --with-start argument in the previous invocation to get the value for START for this invocation:

```
zenimpactgraph run -x build --workers=6 --with-start=START --with-limit=100000
```

- 4. Repeat step 3 until all nodes are processed.
- 5. Add color attributes to nodes (used in the Impact View).

```
zenimpactgraph run -x color
```

6. Send objects to the impact-server process.

```
zenimpactgraph run -x push
```

Downloading and staging 5.4.x packages

To perform this procedure, you need:

- · A workstation with internet access.
- · Permission to download files from delivery.zenoss.com. To request permission, file a ticket at the Zenoss Support site.
- · A secure network copy program.

Follow these steps:

- In a web browser, navigate to the download site, and then log in. The download site is delivery.zenoss.com.
- 2. Download the Docker image file for Service Impact.
 - install-zenoss-impact_VERSION.run

Replace VERSION with the most recent version number available on the download page.

- 3. Download the Service Impact ZenPack files.
 - ZenPacks.zenoss.ImpactServer-VERSION-py2.7.egg
 - ZenPacks.zenoss.Impact-VERSION-py2.7.egg

Replace VERSION with the most recent version number available on the download page.

- 4. Use a secure copy program to copy the Docker image file and the ZenPack files to the Control Center master host.
- 5. Log in to the Control Center master host as root, or as a user with superuser privileges.
- 6. Stage the Docker image file and ZenPack files in /tmp.

1. Create a directory in /tmp for the files.

The directory must be local (not mounted) and must be readable, writable, and executable by all users. For example, /tmp/impact.

mkdir /tmp/impact

- 2. Copy or move the Docker image file and ZenPack files to /tmp/impact.
- 3. Change the file permissions.

The files must have the same permissions as their parent directory.

chmod -R 777 /tmp/impact

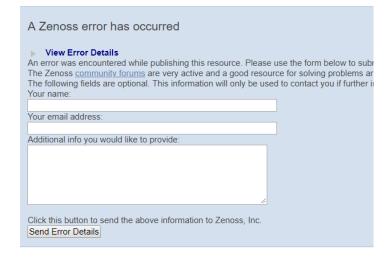

Exporting all dynamic services

The 5.4.x update process requires a successful export of all existing dynamic services.

Follow these steps to export the services:

- 1. In Resource Manager, navigate to SERVICES > Dynamic Services.
- 2. In the tree view of organizers, select DYNAMIC SERVICES.
- 3. From the tool menu at the bottom of the tree view, select Export Selected.
- 4. Verify that the export file downloaded to your workstation successfully.

If you get an error such as the following, the export failed:

If the export fails, perform the following procedures before continuing:

- · Downloading and staging export fix packages
- Installing the export fix package

When you complete the procedures, return to the steps at the beginning of this page and export the services.

Downloading and staging export fix packages

To perform this procedure, you need:

- A workstation with internet access.
- Permission to download files from delivery.zenoss.com. To request permission, file a ticket at the Zenoss Support site.
- A secure network copy program.

Follow these steps:

- In a web browser, navigate to the download site, and then log in. The download site is delivery.zenoss.com.
- 2. Download the following files:
 - install-zenoss-impact_5.3_5.3.4.0.1_34.run
 - ZenPacks.zenoss.ImpactServer-5.3.4.0.1-75-py2.7.egg

- 3. Use a secure copy program to copy the files to the Control Center master host.
- 4. Log in to the Control Center master host as root, or as a user with superuser privileges.
- 5. Stage the files in /tmp.
 - 1. Create a directory in /tmp for the files.

The directory must be local (not mounted) and must be readable, writable, and executable by all users. For example, /tmp/impact.

mkdir /tmp/impact

- 2. Copy or move the downloaded files to /tmp/impact.
- 3. Change the file permissions.

The files must have the same permissions as their parent directory.

chmod -R 777 /tmp/impact

- 6. Install the image.
 - Change directory to the location where the image file is stored.
 For example, /tmp/impact:

cd /tmp/impact

2. Install the image.

yes | ./install-zenoss-impact_5.3_5.3.4.0.1_34.run

Installing the export fix package

Perform this procedure to install export fix package prior to updating to 5.4.x.

- 1. Log in to the Control Center browser interface.
- 2. In the Application column of the Applications table, click Resource Manager.
- 3. Scroll down to the Services table, and then locate the Impact service in the Infrastructure section.
- 4. Click Impact, and then locate the State Change Queue Length graph.
- 5. Log in to the Control Center master host as a user with serviced CLI privileges.
- 6. Stop the zenimpactstate service, and then verify that it stopped.
 - 1. Stop the zenimpactstate service.

serviced service stop zenimpactstate

2. Verify that the service is stopped.

watch serviced service status zenimpactstate

- 7. In the Control Center browser interface, monitor the length of the state change queue. When the queue length is 0 (zero), proceed to the next step.
- 8. Stop the Infrastructure/Impact service, and then verify that it stopped.
 - Stop the Infrastructure/Impact service.

serviced service stop Infrastructure/Impact

2. Verify that the service is stopped.

watch serviced service status Infrastructure/Impact

9. Extract the upgrade script from the ZenPacks.zenoss.ImpactServer ZenPack, make the script executable, and start the upgrade script.

Change to the directory in which the Service Impact ZenPack egg file is located.
 For example, the /tmp/impact directory:

cd /tmp/impact

Extract the upgrade script from the ZenPacks.zenoss.ImpactServer egg file. Replace Version with the ZenPack version number:

unzip -p ZenPacks.zenoss.ImpactServer-5.3.4.0.1-75-py2.7.egg
ZenPacks/zenoss/ImpactServer/upgrade/upgrade.sh > upgrade.sh

3. Make the script executable.

chmod +x upgrade.sh

4. Start the upgrade script.

./upgrade.sh

Note: The upgrade script might display CRITICAL warning messages, which can be ignored.

- 10. Start the Infrastructure/Impact service, and then verify that it started.
 - 1. Start the Infrastructure/Impact service.

serviced service start Infrastructure/Impact

2. Verify that the service is started.

watch serviced service status Infrastructure/Impact

- 11. Log in to the Control Center browser interface.
- 12. Restart Zenoss services.

serviced service restart Zenoss.resmgr/Zenoss

Alternatively, restart the Zenoss services by using the Control Center browser interface.

Preparing to update to 5.4.x

This section includes steps to perform before starting the process of updating Service Impact.

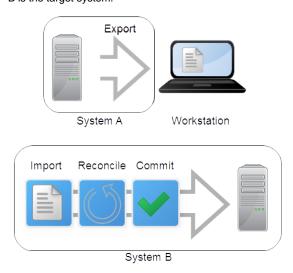

- 1. Update Resource Manager to 6.3.x or a later release.
 - Previous releases of Resource Manager do not include features that Service Impact 5.4.x requires.
- Verify that Resource Manager is operating normally.For more information, see Preparing a deployment for update.

Perform the remaining procedures during a scheduled maintenance window.

Exporting service models from one system to another

You can create a service model on one Resource Manager system (the originating system) and export that model to another system (the target system). This feature is useful for tasks such as repopulating a test or staging environment from a production environment, and performing repeated exporting and model synchronization from develop, to staging, to production environments. Review the following use case example and process overview.

"Project Zebra" is a complicated new E-commerce web application with many clustered entities. The application has been tested in a staging environment (the originating Resource Manager system), and the service model is ready to export from staging to the production environment (the target Resource Manager system). The following diagram illustrates the steps in the process; System A is the originating system and System B is the target system.

Exporting

On the originating system, select the dynamic service, dynamic service organizer, or set of dynamic services to export their service models. The export process generates a file in GraphML XML format that describes the structural properties of the service models, including the devices, components, logical nodes, and their relationships. On your workstation, save the exported file (referred to in this document as svc_export. graphml).

The export file contains definitions for entities that are explicitly defined in the service model. It does not include nodes that Service Impact identified as having an impact relationship and added. For example, service model SM1 defines only an application server device member, App Server A. However, Service Impact evaluated App Server A and infrastructure dependencies on the VM, VM OS, VM host, and file systems on which it resides. Service Impact automatically added the related service model members to the service model SM1. When service model SM1 is exported, the export file contains only service model SM1 and App Server A. When service model SM1 is imported and committed on the target system, a new version of service model SM1 is generated that is unique to the infrastructure dependencies of the target system.

Importing

On the target system, you import the exported file, which imports the service model definitions to view into a working "sandbox" testing environment. While in the sandbox, service models are not operational and are not available in the Resource Manager browser interface. Before moving a service model out of the sandbox, you must complete the reconcile and commit steps.

The initial import process automatically attempts to reconcile (match) each service model member that the exported file references with a corresponding entity on the target system. For example, for Project Zebra, some devices in the staging and production environments might be shared. Others, like the database, will be replaced in the production environment by different entities in the same role. With the higher scalability that production requires, the clusters in the production environment might have more entities. Some entities might not exist or be known on the target system. Such differences must be reconciled before the new application is moved into production.

The import process generates text files to report the results and identify UNRECONCILED entities. This document refers to the files as svc_export.graphml.latest.txt and svc_export.graphml.nnnn.txt.

Reconciling

The generated text files provide known details about UNRECONCILED entities. Using that information, you search for and edit svc_export. graphml.latest.txt to identify corresponding entities on the target system. Your edited version of svc_export.graphml.latest.txt provides input for each reconcile attempt.

Committing

After you have reconciled the service models in the sandbox, perform the final commit. The committed service models are active and begin analyzing Resource Manager events when appropriate, and generating service events. View and work with the service models in the SERVICES tab of the Resource Manager browser interface.

Details about entities that required manual reconciliation are retained on the target system. Future service model imports of the same entities will be reconciled automatically. For example, for Project Zebra, the first import-reconcile-commit process on System B required a manual mapping of

database "Test_DB1" to "Prodxn_DB1." Future imports on System B of service models that reference "Test_DB1" will automatically refer to "Prodxn_DB1" instead.

You cannot reverse a commit; however, you can start a new import process or edit the service model definition in the Resource Manager browser interface.

Exporting a service model

Select service models on the originating system and generate the export file that you will use as input to import on the target system.

- 1. In the Resource Manager browser interface, select the SERVICES tab.
- 2. In the tree view, select the service models to export.
- 3. From the Action menu at the bottom of the tree view, select Export Selected.
- 4. Save the generated export file (svc_export.graphml) on your workstation.
- 5. Proceed with Importing service model definitions.

Importing service model definitions

Perform the procedures in this section to import a service export file in graphml format that contains service model definitions.

The service models in the export file are imported into a non-operational "sandbox" environment on the target system. The service model remains hidden in the sandbox through the reconcile phase, and does not appear in the browser interface until you perform the final commit.

The import and reconcile process typically supports files that were exported by the same or different Resource Manager instance and version (older or newer), and Service Impact versions (older or newer). If an export file's content is incompatible with a version of import, incompatibilities can usually be resolved by adjusting the graphml file content or structure.

- · Preparing to import
- Initiating the import
- · Reconciling originating and target system entities
- Attempting to reconcile
- · Canceling the service model reconcile
- Adding the service models to the target system
- · Future export scenarios and machine learning
- zenimpactimport
- Example export file
- Example import results file

Preparing to import

For example:

Before you can import, you must copy the export file from your workstation to the target system master host and connect to that master host.

Prerequisite: Generate an export file (see Exporting a service model).

- 1. Log in to the Control Center host on which the zenimpactstate service is running.
- 2. Create a directory for the exported file on the Control Center master host.

 The directory that contains the exported file must be a local directory (not mounted) and must be readable, writable, and executable by all users. The following example creates a directory in /tmp:

```
mkdir /tmp/impact && chmod 777 /tmp/impact
```

3. Change directory to the directory you created.

cd /tmp/impact

4. Log in to the Control Center master host as a user with serviced CLI privileges.

5. Copy the exported graphml file from your workstation to the new directory (if on the same host) or use scp to perform a network copy. For example:

```
scp export_impact_svcname_20161215203455.graphml
zenossuser@impacthost.company.com
```

6. Connect to the zenimpactstate container.

serviced service shell -i zenimpactstate

7. In the new session, switch user from root to zenoss.

```
su - zenoss
```

8. Change directory to the pwd directory:

For example:

cd /mnt/pwd

Proceed with the initial import.

Initiating the import

In the initial import, service models from the exported file are imported into the sandbox, the product attempts to reconcile service model members from the originating system with entities on the target system, and output files are generated to show the result of the reconciliation attempt and actions to take.

Prerequisites:

- Generate an export file (see Exporting a service model).
- Copy the export file to the target system and log in (see Preparing to import).
- 1. Initiate the import.

```
zenimpactimport -i svc_export.graphml
```

The exported data is imported to the target system; the first reconciliation attempt is made, and generated text files report the results.

- 2. Review import results in file svc_export.graphml.latest.txt, and then proceed as follows:
 - If Nodes unreconciled is 0, proceed with Adding the service models to the target system.
 - If Nodes unreconciled is 1 or greater, proceed with Reconciling originating and target system entities.
 - If the import ends in an error or you do not plan to commit the import, proceed with Canceling the service model reconcile.

Reconciling originating and target system entities

The reconcile phase is an iterative process in which you attempt to match devices or components from the originating system with their equivalents on the target system.

Multiple attempts to reconcile are often required before you can commit a service model that originated on another system. For faster progress, make multiple small changes and frequent attempts to reconcile.

Begin by reviewing the text files that the initial import generated. Files svc_export.graphml.latest.txt and svc_export.graphml.0001.txt are identical. Each attempt to reconcile generates a new "latest" file and a new, sequentially numbered file to provide a record of your changes. Do not modify the numbered files.

For each service model member, one of the following results or actions exists. When the attempt to reconcile succeeds, results are reported. When you must manually correct exceptions in the model, actions provide guidance. <NodelD> identifies the imported service model member. Do not modify the node ID. <TargetNodeID> is the DMD ID, name, or GUID of the target entity to apply to the imported service model member.

UNRECONCILED < NodeID>

The result for any member on the originating system that the service model references but which cannot be identified on the target system.

MAP <NodeID> <TargetNodeID>

The result if a matching entity was found on the target system or an action to take for an UNRECONCILED service model member. Replace UNRECONCILED with MAP and specify the DMD ID, name, or GUID for the target entity. For example, you might MAP to specify that device "stage-AppSvr1" should reference "prod-AppSvr1" in production.

```
MAP stage-AppSvrl prod-AppSvrl
```

Note: Some cases might require that you first define and model a device in Resource Manager so that the next reconcile attempt can detect it either automatically or manually through use of the MAP action.

CREATE < NodeID>

An action to take when no matching entity was found in the target system, but an entity can be created through import. For example, you might CREATE to add a device for production when a similar device does not exist in staging.

	- 1
	- 1
	- 1
	- 1
	- 1
	- 6

CREATE prod-AppSvr1

DELETE < NodeID>

The result when a matching entity was found in the target system, and it is marked to be deleted in the import file, or an action to take when an entity is not needed. Use DELETE to delete the device, not just remove it from the service model. Replace UNRECONCILED with DELETE and specify the DMD ID, name, or GUID.

For example, you might DELETE to remove a device in production.

DELETE prod-AppSvr1

If the <NodeID> does not exist in the target system, the action is converted to IGNORE.

IGNORE < NodeID>

An action to take for an imported service model member. For example, you might IGNORE because a similar entity does not exist in production.

IGNORE stage-AppSvr1

Before you commit, you must edit svc_export.graphml.latest.txt (or another version of the file) to specify action data. That is, replace UNRECONCILED entries with MAP, CREATE, DELETE, or IGNORE action syntax, and then attempt to reconcile.

Note: In some cases, such as when target devices are not yet online, you might commit and make the service model active even with a few UNRECONCILED entries. Reconcile the remaining UNRECONCILED entries later by importing the same export file or a new file. This approach is useful if you plan to repeat the export to the same target, such as after upgrades or service model changes. You will not need to manually reconcile the same entries each time. You can also manually adjust committed service model definitions later in the target system by using the browser interface.

Attempting to reconcile

Prerequisites:

- · Generate an export file (see Exporting a service model).
- Copy the export file to the target system and log in (see Preparing to import).
- Complete the initial import (see Initiating the import).
- · Review Reconciling originating and target system entities.

For more information about the zenimpactimport command and options, see zenimpactimport or access the help information:

zenimpactimport -h

- In svc_export.graphml.latest.txt or another version of the file, replace UNRECONCILED with an action to specify how the exception should be reconciled.
- 2. Change directory to the directory that contains files svc_export.graphml.latest.txt and svc_export.graphmlnnnn.txt.
- 3. Initiate the reconcile attempt.

zenimpactimport -r svc_export.graphml

The zenimpactimport command attempts to reconcile the originating and target systems, and generates new versions of files svc_export. graphml.latest.txt and svc_export.graphml.nnnn.txt.

- 4. Review import results in file svc_export.graphml.latest.txt, and proceed as follows:
 - If Nodes unreconciled is 1 or greater, repeat the reconciliation process.
 - If Nodes unreconciled is 0, proceed with Adding the service models to the target system.
 - If the import ends in an error or you do not plan to commit the import, proceed with Canceling the service model reconcile.

Canceling the service model reconcile

You might need to remove an uncommitted import attempt from the target system sandbox and free up sandbox resources. Prerequisites:

- Generate an export file (see Exporting a service model).
- Copy the export file to the target system and log in (see Preparing to import).
- Complete the initial import (see Initiating the import).

You can specify the import attempt to cancel in the following ways:

```
By import file name:
     zenimpactimport --import filename.graphml --abort
By reconcile file name:
     zenimpactimport --reconcileFile filename.graphml.latest.txt --abort
By action file name:
     zenimpactimport --actionFile filename.graphml*.latest.txt* --abort
By source and version. First, generate a list of import attempts:
     zenimpactimport --list-imports
Then specify source, version, or both:
     zenimpactimport --source sourceID --abort
     zenimpactimport --import-version versionID --abort
     zenimpactimport --source sourceID --import-version versionID --abort
The following example lists the import versions, the command to remove an uncommitted import, and the resulting list of import versions.
     $ zenimpactimport --list-imports
     Date
                           Source
                                                    Version
                                                                    Status
     2018-02-13 14:59:36 d6fc-b4fe-00505694381d 1481662776493 COMMITTED

```

Adding the service models to the target system

When the "latest" file identifies no UNRECONCILED nodes, commit the reconciled service models that are in the sandbox. After the commit, imported service models, organizers, logical nodes, global and contextual policies, and custom state providers are added to the target system. Service models are operationally active to process device and service events, and are listed in the SERVICES tab of the browser interface. Prerequisites:

- Generate an export file (see Exporting a service model).
- Copy the export file and log in to the target system (see Preparing to import).
- Complete the initial import (see Initiating the import).
- Reconcile devices or components from the originating system with their equivalents in the target system (see Attempting to reconcile).
- Review the following considerations:
 - It is possible to commit the file with UNRECONCILED nodes, however, those members are lost from the resulting service model.
 - A final commit cannot be reversed. To change the model definition after committing, edit the service model definition in the SERV ICES tab or delete the service model and start a new export process.

You can specify the import attempt to commit in the following ways:

```
By import file name:

zenimpactimport --import filename.graphml --commit

By reconcile file name:

zenimpactimport --reconcileFile filename.graphml.latest.txt --commit

By action file name:

zenimpactimport --actionFile filename.graphml*.latest.txt* --commit

By source and version. First, generate a list of import attempts:

zenimpactimport --list-imports

Then specify source, version, or both:

zenimpactimport --source sourceID --commit

zenimpactimport --import-version versionID --commit

zenimpactimport --import-version versionID --commit
```

Future export scenarios and machine learning

In the future, service models for dynamic services that you import might reference the same service model members that required manual reconcile actions in a previous import. The previous manual reconciliation and machine learning of mapped members simplifies each future export.

For example, the service model for dynamic service "S" in a Resource Manager staging environment refers to devices A,B, and C. In the production environment, the imported service model must be reconciled to map to the shared device A, and to equivalent devices X and Y instead of B and C.

Initial import of service model "S" into production

After the initial import, B and C were UNRECONCILED. You created MAP actions to reconcile B to X and C to Y, and then committed with svc_ex port.graphml.latest.txt.

Import 2 of service model "S" to the same production system

A few weeks later, an upgrade to service model "S" adds device "D." The changed service model "S" with devices A,B, C, D is imported into production, where service model "S" must have entities A,X,Y, Z. Previously, you mapped and committed the service model with B mapped to X and C mapped to Y. After import 2, file svc_export.graphml.latest.txt shows only one UNRECONCILED entry, for added device "D." Resource Manager learned and automatically mapped B and C to X and Y. This time, you only need to manually add a MAP action for "D" to "Z", and then commit.

Import 3: initial import of the service model for dynamic service "T"

A third import occurs into production for a different service, "T." Service model "T" contains devices A and D. After the import and automatic reconcile attempt, no UNRECONCILED entries exist for "T." That is, Resource Manager automatically found and mapped A, and used knowledge from your previous mapping of device D to Z for a different service import. In production, service model "T" contain devices A and Z.

Import 4: service model "T" with a different mapping of an entity than in "S" service context

A fourth import occurs, this time of service model "T" with service model members A, B, D. However, in the context of service "T," device B should be mapped to device "P." In production, service model "T" should contain service model members A, P, Z.

After the import and automatic reconcile attempt, no UNRECONCILED entries exist, but svc_export.graphml.latest.txt shows D mapped to Z and B mapped X. You must manually MAP B to P, reconcile, and them commit. As a result, the model for service "T" contains A, P, Z.

zenimpactimport

DESCRIPTION

zenimpactimport - Imports a GraphML file that contains Service Impact the service model definitions for a dynamic service; imports multiple subsequent calls to process new actions in order to reconcile a service model against the entities in Resource Manager.

The import process generates files that report the result of the import and recommend actions. The files follow the same format as the --action command line parameter. An action consists of an action keyword followed by parameters for that type of action. Actions and parameters are separated by white space, with each action on a separate line.

For more information about the import process, see Importing service model definitions.

SYNTAX

zenimpactimport (IMPORT_FILE | IMPORT_ID | ACTION_FILE) ACTIONS*
[TRANSACTION]

COMMANDS and OPTIONS

--import, -i

Perform the import operation.

--reconcile, -r

Perform the reconcile operation.

--help, -h

Show the help information.

--list-imports

Displays a list of existing imports and their status. Each import is uniquely identified by source and version identifiers.

--list-adapters

Displays a list of adapters that are installed to parse and recognize export file content and structure. The "zenoss" adapter expects a Zenoss Service Impact service export file in graphml format.

IMPORT_FILE

--import IMPORT_FILENAME [--adapter ADAPTER]

Performs the initial import of a file in graphml format that generates and attempt to reconcile service model members with entities on the target Resource Manager system.

IMPORT FILENAME

The file that contains the data in a format that the ADAPTER recognizes. The default file name is svc_export.graphml.

ADAPTER

The name of an input adapter. Currently, only the default adapter for the Zenoss graphml export format is supported.

IMPORT ID

--source SOURCEID --import-version VERSIONID

Performs the import of the attempt that you specify by source ID, version ID, or both. Each import is uniquely identified by source and version identifiers. To display imports, issue the --list-imports command.

The *.latest.txt file is rewritten by the latest command that uses the specified combination of source/D and version/D.

ACTION FILE

(--actionFile | --reconcileFile) FILENAME

Performs the import using data in the specified file.

FILENAME

A text file that contains reconcile actions. If no FILENAME is specified on the command line, file svc_export.graphml.file.latest.txt is used as input.

ACTIONS

--action ACTION

Provides a way to execute a single reconciliation action on the command line, rather than editing the input file or the parameter -- actionFile. For more information about the actions, see Reconciling originating and target system entities.

CREATE NodeID

Creates the specified node on the target system.

DELETE NodeID

Deletes the specified node from the target system.

MAP NodeID TargetNodeID

Replaces the specified node on the originating system with the specified node on the target system.

IGNORE NodeID

Takes no action for the specified node.

UNRESOLVED NodeID

The specified node is referenced in the service model but it cannot be reconciled with a node on the target system.

TRANSACTION

{--abort|--commit}

Abort or commit the import attempt that is identified by its unique combination of source ID and version ID. Aborting destroys the import sandbox. Committing makes all entries in the input file permanent and operational in the target system. The last committed combination is the final result.

Example export file

The generated export file name is in the format export_impact_svcname_YYYYMMDDHHMMSS.graphml, where

- · export is the name of the action that is performed.
- impact is the name of the Resource Manager plugin that performs the action.
- service is the name of the service model, a service organizer, or dynamic services environment that you selected for export.
- YYYYMMDDHHMMSS is the timestamp of the export action.

For example, export_impact_DynamicServices_20160331135219.graphml. Note: This document refers to the file as svc_export.graphml. The export file name is included in the names of the text files that the import process and each reconciliation attempt generate. For example, if file export_impact_DynamicServices_20160331135219.graphml is imported, then the text file names are:

 $export_impact_DynamicServices_20160331135219.graphml.latest.txt$

export_impact_DynamicServices_20160331135219.graphml.nnnn.txt

The following example shows the export file for a service named BizSvcA. The service model contains types DEVICE, SERVICE, and COMPONENT (PROP_element_type_id).

- The service is named BizSvcA (PROP_name) and it is a dynamic **service** (PROP_meta_type).
- The devices are named PROD_SQL SERVER and vcloud-01.zenosslabs.com (PROP_name). They are a device and a vCloudCell, respectively (PROP_meta_type).
- The components are named APP_DB1 and tempdb (PROP_name). They are a WinSQLDatabases (PROP_meta_type).
- Four impact relationship edge members from each device and component.

```
node"/>
  <key attr.name="PROP_priority" attr.type="string" for="node"/>
  <key attr.name="INTRINSIC_STATE_PERFORMANCE" attr.type="string" for="</pre>
node"/>
  <key attr.name="RELATED_EVENT_IDS" attr.type="string" for="node"/>
  <key attr.name="NODE_TYPE" attr.type="string" for="node"/>

Example import results file

The initial import generates svc_export.graphml.latest.txt to report the results of the process. The following example shows unreconciled, created, and mapped service model members.

Be aware that the svc_export.graphml.latest.txt is rewritten by the latest command that uses the specified combination of sourceID and versionID.

UNRECONCILED

In this example, the initial import could not match databases DB3From, DB2From, and tempdbFrom with databases on the target system. Manual reconciliation is needed. For UNRECONCILED entries, known information is displayed so that you can search the target system for a corresponding entity. In the example, PROP_meta_type indicates that a WinSQLDatabase is referenced, PROP_element_type_id shows that it is a COMPONENT, and PROP_name shows the database name. After the EXTERNAL_ID has been reconciled, subsequent outputs do not include these details.

CREATE

For imported service DBSvcExpTarget, a matching service does not exist on the target system. The import command generated a CREATE statement for that service and displays related details about the service that is being created.

MAP

For the SQL Server device and database from the originating system, the import process found and mapped the same members on the target system. Details about the members are not displayed because manual reconciliation is not needed.

```
$ cat DBSvcExpFROM.graphml.latest.txt

Adding an Impact Services portlet

You can customize the Resource Manager dashboard by adding an Impact Services portlet. Prerequisites: Service Impact must be installed and at least one dynamic service must exist.

- 1. In the Resource Manager browser interface, choose DASHBOARD.
- 2. In the top-right of the main dashboard area, click Add, and then choose Add portlet.
- 3. From the Portlet drop-down list, choose Impact Services.
- 4. In the Preview pane, choose the services that you want to show in the portlet, and then click Add.

Production state propagation threshold

Service Impact relies on device production states to decide whether to propagate availability and performance states within a service graph.

The following table characterizes the device production states that are available in Resource Manager.

Production state	Devices monitored?	Appear on dashboard?
Production	Yes	Yes
Pre-Production	Yes	No
Test	Yes	No
Maintenance	Yes	Might appear
Decommissioned	No	No

Devices are displayed in the Impact View as determined by production state and production state propagation threshold. Each threshold setting indicates which states are considered to be "in production." For example:

- The threshold value Production indicates that only production-level devices are to be considered "in production."
- The threshold value Decommissioned indicates that devices in all production states are to be considered "in production."

In the Impact View, background color indicates the node's production state. In the following table,

- FALSE indicates that the node is displayed with a gray background, and its state is not propagated upwards to other members.
- TRUE indicates that the node is displayed with a white background, and interacts with other members as "in production."

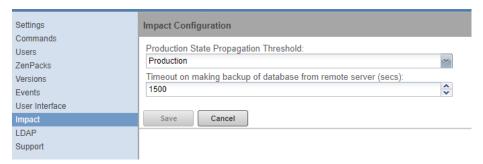

Device production state	Threshold= Production	Threshold= Pre-Production	Threshold= Test	Threshold= Maintenance	Threshold= Decommissioned
Decommissioned	FALSE	FALSE	FALSE	FALSE	TRUE
Maintenance	FALSE	FALSE	FALSE	TRUE	TRUE
Test	FALSE	FALSE	TRUE	TRUE	TRUE
Pre-Production	FALSE	TRUE	TRUE	TRUE	TRUE
Production	TRUE	TRUE	TRUE	TRUE	TRUE

For more information about production states, see Production states and maintenance windows.

Configuring the production state propagation threshold

The default value of the Service Impact production state propagation threshold is Production. You can select a different production state for the threshold. Zenoss recommends changing this threshold only during installation.

- 1. Log in to the Resource Manager browser interface as a user with ZenManager or Manager privileges.
- 2. Select the ADVANCED tab, and then click the Impact link in the left column.

3. From the Production State Propagation Threshold list, select a new production state, and then click Save.

Devices are evaluated against the new threshold at the next modelling interval. To update all devices before the next modelling interval, perform a graph update.

Service Impact server configuration files

The Service Impact server configuration files are stored in the Infrastructure/Impact container. Zenoss recommends that you edit configurations through the Control Center browser interface, which ensures that changes are preserved and pushed to new containers on restarts.

Use the Control Center browser interface to edit and preserve changes to /opt/zenoss_impact/etc/logback.xml. Modifying logback.xml in the Control Center browser interface requires a restart of the Service Impact service for the logging changes to take effect. If you use the command line to implement logging changes, they are implemented immediately; however, the changes made using the command line are lost when Service Impact is restarted.

To test changes in a pre-production environment, modify configuration file settings directly in the container. When Service Impact is restarted, all settings are returned to their default value.

Follow these steps to edit Service Impact configuration files:

- 1. Log in to the Control Center browser interface.
- 2. In the Applications table, click Zenoss.resmgr.
- 3. Scroll down to the Services list and select Infrastructure/Impact.
- 4. Under Configuration Files, click Edit to the right of /opt/zenoss/etc/dsa.zenoss-dsa.properties.

 The zenoss-dsa.properties file is displayed in the Edit Configuration window.
 - Note: Modifying properties might change the performance of Service Impact. Before you modify default values, consult Zenoss Support.
- 5. Make changes and then click Save.
- 6. To activate the changes, restart Service Impact.

Targeted graph update

Occasionally, Service Impact receives information about an unknown component or device that is needed for an event. When this occurs, a targeted graph update is performed.

To rapidly update its knowledge of an unknown entity and its impact model, Service Impact targets modeling of only that entity's subgraphs. To allow the modeling workflow to complete, a "placeholder" is immediately created for the unknown entity. Impact graphs are quickly refreshed without delay to event processing.

The targeted graph update allows mission-critical event and service event monitoring and alerting to resume with minimal downtime. During the restore and rebuild of the Neo4j graph database, service event processing resumes quickly, regardless of the size and number of service models.

You can tune targeted graph updates by changing configuration parameters.

Targeted graph update occurs automatically and requires no user intervention. However, in unusual circumstances, Zenoss Support might recommend the following actions:

- Adjusting configuration parameters to better tune performance.
- Repairing information by manually rebuilding impact models with missing entities and impact relationships.

The following sections provide additional information:

- · Tuning targeted graph update
- Manually rebuilding an impact graph
- zenimpactgraph

Tuning targeted graph update

Adjusting targeted graph update settings might cause performance degradation. Change settings only if instructed to do so by Zenoss Support.

- 1. To change settings, open the /opt/zenoss_impact/etc/zenoss-dsa.properties configuration file.
 - For instructions, see Service Impact server configuration files.
- To change the number of nodes that Service Impact processes per batch job, increase or decrease the value of dsa.zenoss. batch size=100.
 - By default, 100 nodes are processed in one update job.
- 3. To change the frequency of targeted updates, increase or decrease the value of dsa.zenoss.time_period=30. By default, the targeted updates occur every 30 seconds as needed.
- 4. After changing values, save the file.
- 5. To activate the changes, restart Service Impact.

Manually rebuilding an impact graph

Service Impact graphs are regularly updated automatically, and rarely require manual actions. However, in unusual circumstances, the Service Impact data store might have inconsistencies that require a manual rebuild of an impact graph to rediscover children of the problem node.

For best performance, do not manually rebuild an impact graph during a time that overlaps a maintenance window. The graph update and maintenance window operations use the same target graph database. Performing them together might lengthen the time to complete the operations, and might result in transaction rollbacks.

Entities that are defined in the Resource Manager object database (ZODB) are normally synchronized and defined in the Service Impact Neo4j datastore. You can manually check consistency between the ZODB and the datastore, and if necessary, rebuild a subset of or all service models.

The manual options allow more granular repair to just a subset of entity impact graphs for all service contexts in which the entity participates. This approach can be much faster than repairing all information. However, if a large amount of entity information must be repaired, rebuilding all with one action might be faster.

To check for consistency between the Resource Manager ZODB and the Service Impact Neo4j datastore, run the following command:

zenimpactgraph run --check

To update impact dependencies for one or more entity nodes for all service contexts in which they participate, run the following command

```
zenimpactgraph run --update --sb <node_name | node_id | node_path> --
direction <0 | 1> --depth <0 | integer>
```

Commands for zenimpactgraph run update are as follows:

• Specify the subgraph by name, path, or ID.

```
--sb=SUBGRAPH, --sub-graph=SUBGRAPH
```

The node path must start with /zport/dmd/. Separate multiple nodes with a comma.

· Specify the maximum traversal depth level of the graph to update.

```
--depth=DEPTH
```

If no depth is specified, the default is to update all nodes in the graph, regardless of the number. Specify an integer value to limit the maximum levels of the graph to be updated.

Specify the traversal direction:

```
--direction=DIRECTION
```

0 indicates INCOMING, to discover or rediscover all nodes that impact the target node. If no direction is specified, the default is INCOMING.

1 indicates OUTGOING, to discover or rediscover all nodes that the target node impacts.

- 1. Log in to the Control Center master host as a user with serviced CLI privileges.
- 2. Connect to the zenimpactstate container as the zenoss user.

```
serviced service attach zenimpactstate su - zenoss
```

Run zenimpactgraph run update with commands. See the following examples.

Example 1: Basic command using defaults

The following commands use default values to discover nodes for the target node. The target node is specified by name, vxchnge-vcenter-02. zenoss.loc. All nodes that impact the target node (incoming direction) and all nodes that the target node impacts (outgoing direction) are discovered. All levels of the graph will be updated (unlimited depth).

```
zenimpactgraph run --update --sb vxchnge-vcnter-02.zenoss.loc
```

Example 2: Discover outgoing nodes for the named subgraph

The following commands discover all nodes that are impacted by the target node, vxchnge-vcenter-02.zenoss.loc. All levels of the graph will be updated (unlimited depth).

```
zenimpactgraph run --update --sb vxchnge-vcenter-02.zenoss.loc --direction 1
```

Example 3: Discover incoming nodes for the named subgraph

The following commands discover all nodes that impact the target node, vSphere, and limit the updates to a depth of 10 levels of the graph.

```
zenimpactgraph run --update --sb vSphere --direction 0 --depth 10
```

Example 4: Discover outgoing nodes for the subgraph at the specified path

The following commands discover all nodes that are impacted by the target node, vxchnge-vcenter-02.zenoss.loc, and limit the updates to a depth of 100 levels of the graph.

```
zenimpactgraph run --update --sb /zport/dmd/Devices/vSphere/devices/vSphere --direction 1 --depth 100
```

Example 5: Discover incoming nodes for the subgraph at the specified path

The following commands discover all nodes that impact the target node, vxchnge-vcenter-02.zenoss.loc. All levels of the graph will be updated (unlimited depth).

```
zenimpactgraph run -update --sb /zport/dmd/Devices/vSphere/devices/vxchnge-vcenter-02.zenoss.loc --direction 0
```

Removing Service Impact

Use this procedure to remove Service Impact from a Resource Manager 5.x or 6.x deployment.

- 1. Log in to the Control Center master host as a user with Control Center CLI privileges.
- 2. Create a snapshot:

```
serviced service snapshot Zenoss.resmgr
```

On completion, the serviced command returns the ID of the new snapshot. If this procedure fails, you can restore the snapshot created in this step. For more information about restoring a snapshot, see Creating snapshots and rolling back.

- 3. Stop the Zenoss services, and then verify that the services are stopped.
 - 1. Stop Resource Manager.

```
serviced service stop Zenoss.resmgr/Zenoss
```

2. Wait until all services are stopped.

Use the watch command to monitor the status.

```
watch serviced service status Zenoss.resmgr/Zenoss
```

- 4. Start the services that are required for the removal of Service Impact.
 - 1. Start the zeneventserver and Zope services.

```
serviced service start zeneventserver zope
```

Wait until the services are started.Use the watch command to monitor the status.

watch serviced service status zeneventserver zope

5. Remove the ZenPacks.zenoss.Impact ZenPack.

Removing the ZenPack also removes the ${\tt zenimpactstate}$ service.

serviced service run zope zenpack-manager uninstall ZenPacks.zenoss. Impact

- 6. Stop and remove the Infrastructure/Impact service, and then remove the ZenPacks.zenoss.ImpactServer ZenPack.
 - 1. Stop the Infrastructure/Impact service, then wait 10 seconds.

serviced service stop Infrastructure/Impact

2. Remove the Infrastructure/Impact service.

serviced service remove Infrastructure/Impact

3. Remove the ZenPack.

serviced service run zope zenpack-manager uninstall ZenPacks. zenoss.ImpactServer

7. Restart all Zenoss services:

If you are updating to version 5.4.x, skip this step.

serviced service restart Zenoss.resmgr/Zenoss

Service Impact MIB file

Service Impact includes its own SNMP management information base (MIB) file. The file is located here:

/opt/zenoss/ZenPacks/ZenPacks.zenoss.Impact-VERSION-py2.7.egg/ZenPacks/zenoss/Impact/share/mibs/ZENOSS-IMPACT-MIB.txt

The file is a supplement to the standard Zenoss MIB file, containing definitions for events that are unique to Service Impact. To use this MIB file in other applications that receive traps, you must install both this file and the Zenoss MIB file.

Optionally, the events defined in this file may be used in notifications.

Dynamic service name restrictions

Only the following characters are allowed in the names of dynamic services and dynamic service organizers:

- upper-case and lower-case letters of the Basic Latin character set (A-Z,a-z)
- digits (0-9)
- the space character ()
- the full stop character (.)
- the hyphen-minus character ()
- the low line character (_)
- the number sign character (#)

- the dollar sign character (\$)
- the left parenthesis character (()
- the right parenthesis character ())

In object IDs, the number sign character (#) is replaced with the low line character (_). In titles, the number sign is unchanged.

Service Impact home page

The home page of the Service Impact feature is SERVICES > DYNAMIC SERVICES, which displays the health summaries of all dynamic services.

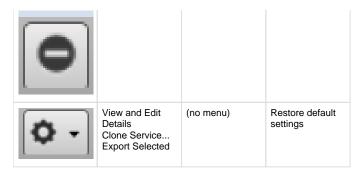

From the home page, you can choose the LOGICAL NODES or METATYPE CONFIGURATION tabs.

Tree view area

The tree view area displays service nodes and logical nodes in alphabetical order. You can create organizers and order them as you wish. To move service nodes and logical nodes into organizers, drag them into the tree view.

Tool	Menu		
	DYNAMIC SERVICES	LOGICAL NODES	METATYPE CONFIGURATI ON
+ •	Add Dynamic Service Add Dynamic Service Organizer	Add Logical Node Add Logical Node Organizer	(no menu)
	(no menu)	(no menu)	(no menu)

Primary view area

The content of the primary view area depends on which tab is selected, and for some tabs, which item is selected in the tree view area.

Tab	Tree view selection	Primary view contents
DYNAMIC SERVICES	DYNAMIC SERVICES (the root organizer)	The availability and performance health summaries of all services.
	An organizer	The availability and performance health summaries of the services that the organizer contains.
	A dynamic service (service model)	The Members of the selected service. From this view, select Impact Events or Impact View.
LOGICAL NODES	LOGICAL NODES (the root organizer)An organizer	A blank logical node details view.
	A logical node	The details view of the selected logical node. No other views are associated with logical nodes.
METATYPE CONFIGURATION	The list of ZenPacks with metatypes defined	The components that can be excluded from all dynamic services that include the components.

DYNAMIC SERVICES page

The SERVICES > DYNAMIC SERVICES page provides the most-frequently-used features of Service Impact.

- Members view
- Add to Service dialog box
- Impact Events
- Impact View
- Impact Policies dialog box

Members view

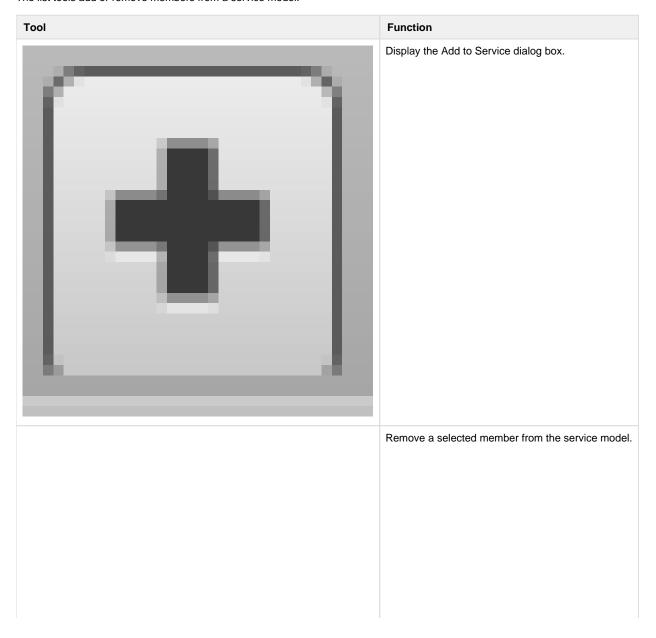

The Members view provides details about a service member, including the list of its associated members.

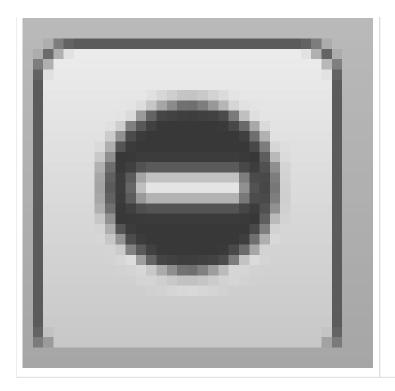

The following example shows the Members view of a service member, with key features highlighted, and the view menu selected.

List tools

The list tools add or remove members from a service model.

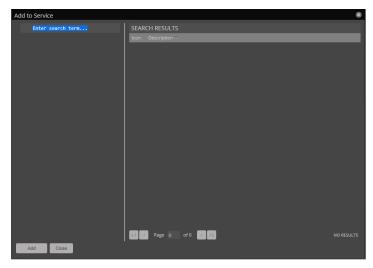

Add to Service dialog box

Use the Add to Service dialog box to find and add members to a service model.

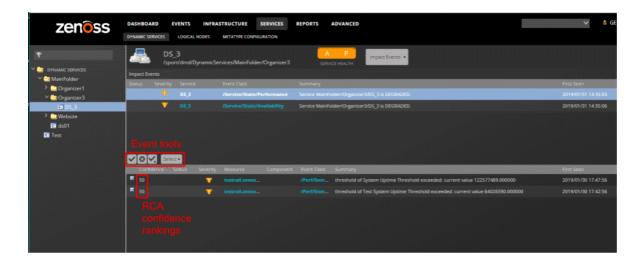

In the search field, enter the string to find. You can search for a specific device or component name, or component type (such as interfaces and OS processes) or group type (such as location and system). As you type characters, Service Impact displays matches.

Impact Events

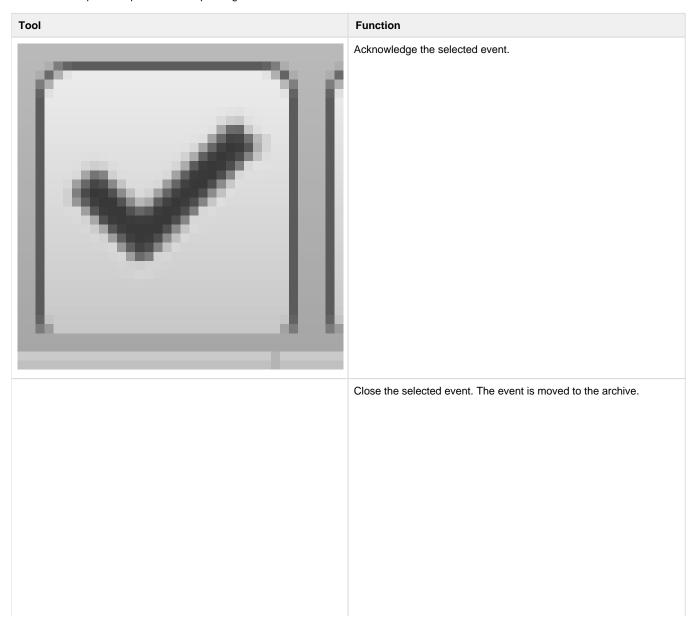

The Impact Events view shows summary and detail information about events that are affecting a service.

The following example shows an Impact Events view with key features highlighted. The last event in the details area is expanded to show the Impact chain, which is the hierarchy of service model members that are associated with the event.

Event tools

The event tools provide options for manipulating the list of events.

Undo acknowledgement of the selected event.

Display the event selection menu.

Select All

Select all events in the list.

None

Deselect all selected events.

Root-cause analysis (RCA) confidence rankings

The second column of the details list contains the event's confidence ranking. Service Impact knows which members affect which service models, and automatically performs RCA when an event occurs. The analysis yields a probability value that an event is the cause of the service's current state. Often, multiple events contribute to a state, so the confidence rankings enable you to quickly focus resources on the most likely cause.

Impact View

The Impact View displays the interactive Service Impact graph of a service model and provides several views and tools.

Service context (root) node name

In the upper left above the Aspect controls, the service context (root) node of the graph is displayed, along with its tree view path. Click the name to make the root node the selected node and display its name in the Selected node field.

Aspect views: Availability, Performance

Use aspect views to display and filter on availability or performance states in the graph.

Selected Node

Displays the name and type of the node that you have chosen, or the service context (root) node if you have not chosen a node. For example, DB Hosts (Organizing Group) is the node named DB Hosts, which is an organizing group type. When you first access the Impact View, the Selected

Node field displays the root node. To resize the Selected Node field, hover the pointer to the left of the field label to display the resize tool, and then drag the tool left or right. When you choose a node from the list or click a tile in the graph, that node appears in Selected Node and the node tile is centered in the graph.

To search for specific nodes, begin typing a string in the Selected Node field. The field's drop-down list displays matching nodes in the following format:

```
node_name (node_type) [UID]
```

Tips for searching nodes:

- · Strings are not case sensitive.
- · Regular expressions are not supported.
- You can search for nodes by name, type, or system-generated unique identifier (UID).
- To search for nodes by name only, suffix the search string with an open parenthesis. For example, the following string matches only node names that end with "Hosts," such as the DB Hosts node.

```
Hosts (
```

However, the following string matches nodes with "hosts" in the name or type.

hosts

To search for nodes by type only, prefix the search string with an open parenthesis. For example, the following string matches only node
types beginning with "vSphere," such as the vSpherePnic type.

```
(vSphere
```

However, the following string matches nodes with "vsphere" in the name or type.

vSphere

To search for nodes that contain the same character string in the UID, prefix the search string with an open bracket. For example, the
following string matches only nodes with a UID beginning with "G7M," such as G7M589.

[G7M

However, the following string matches nodes with "G7M" in the name, type, or UID.

G7M

Zoom

To increase or decrease the size of tiles in the graph, use the mouse wheel or drag the Zoom control in the upper right corner of the view.

Node tools

To see a summary of a node in a Service Impact graph, hover the pointer over its tile. Summary information includes the node name, availability state, performance status, production status, and type.

To display the following menu options for a node, position the pointer over it and right-click:

Toggle Children

Hide or display the node's child and descendent nodes.

Edit Impact Policies

Display the Impact Policies dialog box. See Impact Policies dialog box.

Center view on node

Adjust the view so the selected node is in the center of the display area.

Graph and filter tools (right-click menu)

To display the following Impact View menu options, position the pointer in the primary view area and right-click.

Fit Graph to Window

Adjust the size of the graph so that its dimensions match the display area.

Show All

Display all nodes in the graph, including those that are automatically added by ZenPacks.

Collapse All

Display only the top-level node of the graph.

Compact View

Display only the service model members that you have manually added and the immediate children of a service or service group.

Toggle Rainbows

Display colored tabs at the right edge of the node, indicating the number of critical, error, and warning events associated with the node

Show Filters

Hide or display the filter controls.

Use filter check boxes to select availability and performance states by which to filter. By default, all states are selected for filtering. To restrict displayed nodes to specific states, such as DOWN and UNACCEPTABLE, select only those check boxes. (Changes to the selected states apply to all dynamic services because state is a global feature.)

To filter by complete or partial node name, use the Name field. To perform the filter click Filter.

Export Graph Image

Creates a file of the graph image with the default name graph.png and downloads it to your workstation.

Enable center view

Shift the graph so that the selected node is in the center. The zoom level does not change. You can zoom in and out on the node in the center of the graph. Choose this option to recenter a specific node.

Jump to Selected

Shift the graph so that the node that is shown in the Selected Node field is in the center.

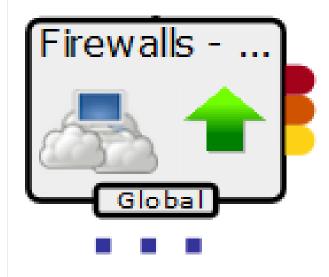

Jump to Context (root)

Shift the graph so that the service context (root) node of the graph is in the center.

Node tile

The node tile graphically represents a server or service node and information about it, as described in the following table:

This tile represents a Linux server named epowell-debug.zenoss. loc. (The name is shortened to fit inside the tile.) The computer icon and penguin image represent the node's type, Linux server. The green arrow and the black border represent the node's availability state, UP. This tile represents a service node with a global policy. Event rainbows are displayed. The event rainbow is the colored tabs on the right side of the tile. From top to bottom, the rainbow shows the counts of critical, error, and warning events that are associated with the node. The

first example node has no events, so no numbers are displayed. The second example node has 1 critical error.

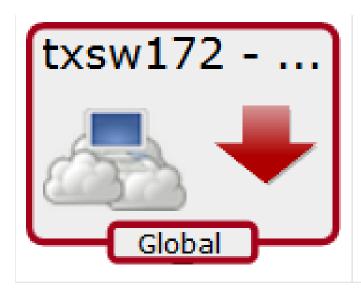

- When you click an event rainbow tab, Collection Zone displays the overview page of the node.
- This tile includes three dots immediately below its bottom border. The dots represent descendant nodes. To display the descendant nodes, double-click the node tile.

This tile represents a service node. The yellow icon and border represent the node's availability state, ATRISK.

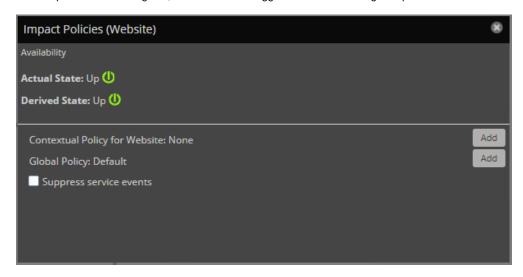

This tile represents a service node with a global policy. The red arrow and the red border of the tile represent the node's availability state, DOWN.

Impact Policies dialog box

In the Impact Policies dialog box, add or edit state triggers for contextual or global policies.

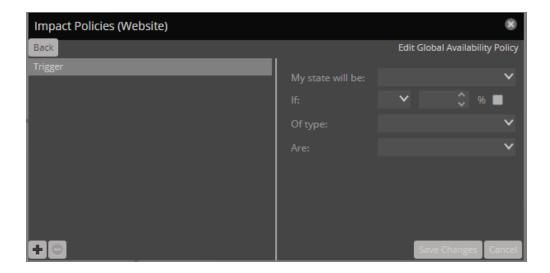

To prevent sending service events when changes affect a node, check Suppress service events. Choose this option when a service node is used solely to group child nodes.

If a custom state provider is not associated with a node, the dialog box does not contain the option to edit the custom state provider.

For a policy or custom state provider, click Add or Edit to access options.

Edit Policy options

Use the Edit Policy options to add or edit state triggers for contextual or global policies.

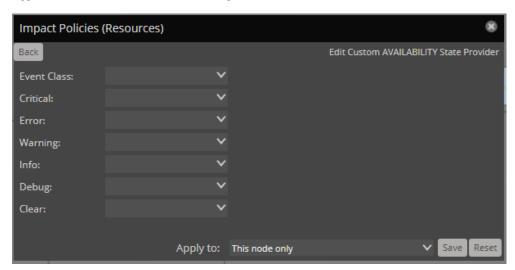

To add a trigger, in the lower-left corner click Add. On the right side of the dialog box, modify the trigger fields (described in the following table), and then click Save Changes.

Field	Description
My state will be	The new state, if the trigger applies. Possible states: DOWN, DEGRADED, ATRISK, UP.
If	The conditions that trigger a state change. To specify a percentage rather than an absolute value, click %.
Of type	Restrict the type of child node to which the trigger applies. Types other than Any are exclusive.
Are	The state of child nodes that cause an evaluation of this trigger. Possible states: DOWN, DEGRADED, ATRISK, UP.

Edit Custom State Provider options

Use a custom state provider to add state triggers (rules) for custom device and component service model members. You can customize Collection Zone to gather state data from events that belong to other classes. For example, you can customize state providers to define state triggers for members that are monitored through customized classes that the ZenVMware and CiscoUCS ZenPacks provide.

Field	Description
Event Class	Choose the Collection Zone event class to monitor. You can configure one event class per device.
Event severity fields (Critical, Error,	Choose the state for this member if the event severity is observed.

Warning, Info, Debug, Clear)	Possible states are UP, ATRISK, DEGRADED, DOWN.
Apply to	Choose the nodes (components) to which the state override applies.
	 This node only: The selected component on the specific device. Nodes of the same type on the same device: The same component type on the same device. If a component is associated with another device, it is not affected in that context. Nodes of the same type in the same device class: The same component type on any device with the same device class. Nodes of the same type system-wide: The same component type, regardless of the device or the device class.

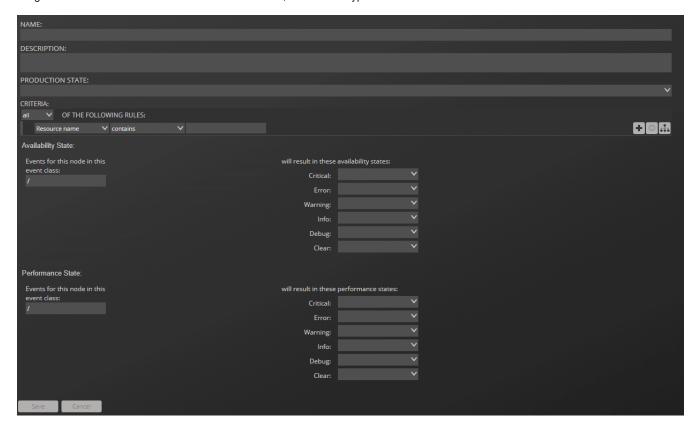

LOGICAL NODES page

The SERVICES > LOGICAL NODES page allows you to create and edit customizable members that capture specific Collection Zone event states.

Logical nodes allow you to represent multiple resources or services; they rarely relate to events from a single member. For resources that Collection Zone monitors, logical nodes enable you to capture event states from arbitrary classes. Logical nodes might be external events from third-party monitoring products that are not monitored by Collection Zone.

For example, a bookstore website uses a third-party financial service to process credit cards. Collection Zone has no access to that third-party environment, but the monitoring systems forward events to Collection Zone. Their member names are prefixed with FincCC (that is, FincCC-AppSvr01, FincCC-AppSvr02, FincCC-OraDB01, and so on). To match events from that system and relate them to the "bookstore" service, you create a logical node that matches any event with a resource name that includes the prefix FincCC.

A logical node can be a child of a service model member, but no other type.

Criteria

The Criteria rules allow you to define event triggers and associate the triggers with availability and performance states.

Using rules that include numeric comparisons—in particular, greater than and less than comparisons—requires a clear understanding of the values that are included in source events. For example, severity values sent by syslog use a scale of 0 to 7, with 7 being the least severe. This is the reverse of the scale that Collection Zone events use.

Availability state

In the "Events for this node in this event class" field, specify the event class or subclass that is associated with the trigger.

The following examples illustrate how to specify event classes.

/Status

Only the /Status class.

/Status/Web

Only the Web subclass of /Status

/Status/

The /Status class and all of its subclasses.

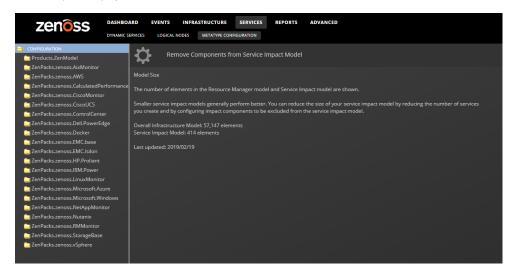

In the "will result in these availability states" field, map event severity levels to availability states.

Performance State

The fields and options in this area differ only in that the mapping of event severity levels to performance states uses different states.

METATYPE CONFIGURATION page

The configuration options on this page remove components from all dynamic service models. Every ZenPack that includes Service Impact relationships is displayed here.

If your Service Impact model is relatively large, you can improve the speed of both Service Impact and Resource Manager by removing unimportant components. For example, you may choose to exclude the server fan or power supply components from virtual machines. When a component is removed in this way, it no longer appears in the Impact View of dynamic services, and component events are not considered in determining the performance or availability of dynamic services.

Zenoss strongly recommends that you contact Zenoss Support to determine whether your environment can benefit by removing components, and to select components to remove.

Release notes

This section contains important information about Zenoss Service Impact (Service Impact) releases.

Date	Release
Mar 2019	5.4.8
Mar 2019	5.4.7 CA

Mar 2019	5.4.6
Feb 2019	5.4.5 CA
Feb 2019	5.4.4 CA
Feb 2019	5.4.3 CA
Feb 2019	5.4.2 CA
Jan 2019	5.4.1 CA
Apr 2018	5.3.1

Resource Manager compatibility

The following table shows compatibility between releases of Service Impact and Resource Manager. For best performance, Zenoss recommends using the latest releases of both products.

Service Impact	Resource Manager
5.4.8	6.3.2
5.4.7 CA	
5.4.6	
5.4.5 CA	
5.4.4 CA	
5.4.3 CA	
5.4.2 CA	
5.4.1 CA	
5.3.1	6.x
	5.2.x and 5.3.x

Service Impact ZenPack compatibility

The following table shows compatibility among versions of the Service Impact ZenPacks.

Release	ZenPacks.zenoss.ImpactServer	ZenPacks.zenoss.Impact
5.4.8	5.4.8.0.0	5.4.8.0.0
5.4.7 CA	5.4.7.0.0	5.4.7.0.0
5.4.6	5.4.6.0.0	5.4.6.0.0
5.4.5 CA	5.4.5.0.0	5.4.5.0.1
5.4.4 CA	5.4.3.0.0	5.4.4.0.0
5.4.3 CA	5.4.3.0.0	5.4.3.0.0
5.4.2 CA	5.4.2.0.0	5.4.2.0.1
5.4.1 CA	5.4.1.0.0	5.4.1.0.0
5.3.1	5.3.1.0.0	5.3.1.0.0

Service Impact 5.4.8

This release includes a major new feature, selective synchronization.

In releases before 5.4.1, the Resource Manager Zope Object Database (ZODB) and the Service Impact graph database were tightly synchronized, and all of the relationships among Resource Manager devices and components in your environment (the "model") were copied to the Service Impact graph database. In larger environments, when Resource Manager model updates were underway, the synchronization process reduced performance in Resource Manager and caused Service Impact to make analyses with incomplete data.

In this release, you can refine the list of components that are copied from ZODB to Service Impact. This approach works well in environments where the critical services defined in Service Impact are a relatively small part of the Resource Manager model.

Additional highlights of this release:

- The SERVICES > Metatype Configuration page is the new interface for deciding which device components to exclude from Service Impact. The page includes counts of the overall number of entities in the Resource Manager model and the Service Impact model, updated regularly.
- The export/import/reconciliation process has been re-implemented to improve accuracy, reduce reconciliation conflicts, and provide progress information.
- The zenimpactgraph run --update process has been re-implemented to scale out to the available host resources. The update
 time is reduced from days to hours.
- The zenimpactworker process is no longer necessary.

Update instructions

Updating from releases before 5.4.x

The update procedures for this release are unique and a special section has been created for them:

Updating Service Impact

The order of steps in the update procedures is crucial. Please review the procedures in advance, and follow the instructions carefully.

Updating from 5.4.x

To update Service Impact to this release from a previous release of 5.4.x, follow the standard update procedure:

Updating Service Impact

When the update is complete, run the following command to synchronize impact-server:

zenimpactgraph run -x push

Known issues

- In previous releases, adding a dynamic service was very quick, because the Service Impact database included all of the devices and
 components in the ZODB. In this release, Service Impact creates a background job to copy the devices and components it requires,
 which can take a few minutes to complete. Scripts that utilize the Service Impact JSON API must be updated to wait for the job to
 complete before proceeding.
- When you change the metatype configuration, the Service Impact database is updated to add or remove nodes. Depending on which items are changed, processing the changes can take 30-90 minutes in very large environments.
- (IMP-699) The upgrade to 5.4.x silently removes leading spaces from dynamic service names, which changes their sort order. To work around the issue, rename the services after the upgrade.
- . (IMP-709) When logged in as Admin, changing the Impact View from performance to availability briefly raises a server exception dialog.

ID	Description
IMP-649	Dynamic service names and organizer names must be updated manually to meet new requirements
IMP-676	Sequential API calls to addToDynamicService results in zenjobs hanging

IMP-700	The Service Impact view includes more virtual machines than are defined in a dynamic service
IMP-707	zenimpactgraph throws a traceback, global name 'IRelationshipNode' is not defined

Service Impact 5.4.7 CA

This is a controlled-availability release. If you are interested in updating to this release, please contact your Zenoss representative.

This release includes a major new feature, selective synchronization.

In releases before 5.4.1, the Resource Manager Zope Object Database (ZODB) and the Service Impact graph database were tightly synchronized, and all of the relationships among Resource Manager devices and components in your environment (the "model") were copied to the Service Impact graph database. In larger environments, when Resource Manager model updates were underway, the synchronization process reduced performance in Resource Manager and caused Service Impact to make analyses with incomplete data.

In this release, you can refine the list of components that are copied from ZODB to Service Impact. This approach works well in environments where the critical services defined in Service Impact are a relatively small part of the Resource Manager model.

Additional highlights of this release:

- The SERVICES > Metatype Configuration page is the new interface for deciding which device components to exclude from Service Impact. The page includes counts of the overall number of entities in the Resource Manager model and the Service Impact model, updated regularly.
- The export/import/reconciliation process has been re-implemented to improve accuracy, reduce reconciliation conflicts, and provide progress information.
- The zenimpactgraph run --update process has been re-implemented to scale out to the available host resources. The update time is reduced from days to hours.
- · The zenimpactworker process is no longer necessary.

Update instructions

Updating from releases before 5.4.x

Updating Service Impact

The order of steps in the update procedures is crucial. Please review the procedures in advance, and follow the instructions carefully.

Updating from 5.4.x

To update Service Impact to this release from a previous release of 5.4.x, follow the standard update procedure:

Updating Service Impact

When the update is complete, run the following command to synchronize impact-server:

zenimpactgraph run -x push

Known issues

- In previous releases, adding a dynamic service was very quick, because the Service Impact database included all of the devices and
 components in the ZODB. In this release, Service Impact creates a background job to copy the devices and components it requires,
 which can take a few minutes to complete. Scripts that utilize the Service Impact JSON API must be updated to wait for the job to
 complete before proceeding.
- When you change the metatype configuration, the Service Impact database is updated to add or remove nodes. Depending on which items are changed, processing the changes can take 30-90 minutes in very large environments.
- (IMP-699) The upgrade to 5.4.x silently removes leading spaces from dynamic service names, which changes their sort order. To work around the issue, rename the services after the upgrade.

ID	Description
IMP-690	Unable to export graph image when using Chrome
IMP-693, IMP-694	The state of a dynamic service is inconsistent when the production state of a member device is changed in Resource Manager

Service Impact 5.4.6

This release includes a major new feature, selective synchronization.

In releases before 5.4.1, the Resource Manager Zope Object Database (ZODB) and the Service Impact graph database were tightly synchronized, and all of the relationships among Resource Manager devices and components in your environment (the "model") were copied to the Service Impact graph database. In larger environments, when Resource Manager model updates were underway, the synchronization process reduced performance in Resource Manager and caused Service Impact to make analyses with incomplete data.

In this release, you can refine the list of components that are copied from ZODB to Service Impact. This approach works well in environments where the critical services defined in Service Impact are a relatively small part of the Resource Manager model.

Additional highlights of this release:

- The SERVICES > Metatype Configuration page is the new interface for deciding which device components to exclude from Service Impact. The page includes counts of the overall number of entities in the Resource Manager model and the Service Impact model, updated regularly.
- The export/import/reconciliation process has been re-implemented to improve accuracy, reduce reconciliation conflicts, and provide progress information.
- The zenimpactgraph run --update process has been re-implemented to scale out to the available host resources. The update
 time is reduced from days to hours.
- The zenimpactworker process is no longer necessary.

Update instructions

The update procedures for this release are unique and a special section has been created for them:

Updating Service Impact

The order of steps in the update procedures is crucial. Please review the procedures in advance, and follow the instructions carefully.

Known issues

- In previous releases, adding a dynamic service was very quick, because the Service Impact database included all of the devices and
 components in the ZODB. In this release, Service Impact creates a background job to copy the devices and components it requires,
 which can take a few minutes to complete. Scripts that utilize the Service Impact JSON API must be updated to wait for the job to
 complete before proceeding.
- When you change the metatype configuration, the Service Impact database is updated to add or remove nodes. Depending on which
 items are changed, processing the changes can take 30-90 minutes in very large environments.
- (IMP-676) Sequential calls in the Zenoss Impact API do not complete successfully when the number of jobs that can be processed concurrently is greater than one. To work around the issue, set the concurrent-jobs directive in the /opt/zenoss/etc/zenjobs.conf file to 1.
- (IMP-699) The upgrade to 5.4.x silently removes leading spaces from dynamic service names, which changes their sort order. To work around the issue, rename the services after the upgrade.

ID	Description
IMP-641	Unexpected behavior from the discard changes popup
IMP-664	Cloning a dynamic service does not work
IMP-686, IMP-689	Nodes with policies are not properly imported
IMP-687	Unable to view or edit policies
IMP-680	Error flare in Impact View, Attribute Error "NoneType" object has no attribute 'dmd'

Service Impact 5.4.5 CA

This is a controlled-availability release. If you are interested in updating to this release, please contact your Zenoss representative.

This release introduces a major new feature, selective synchronization.

In previous releases, the Resource Manager Zope Object Database (ZODB) and the Service Impact graph database were tightly synchronized, and all of the relationships among Resource Manager devices and components in your environment (the "model") were copied to the Service Impact graph database. In larger environments, when Resource Manager model updates were underway, the synchronization process reduced performance in Resource Manager and caused Service Impact to make analyses with incomplete data.

In this release, you can refine the list of components that are copied from ZODB to Service Impact. This approach works well in environments where the critical services defined in Service Impact are a relatively small part of the Resource Manager model.

Additional highlights of this release:

- The SERVICES > Metatype Configuration page is the new interface for deciding which device components to exclude from Service Impact. The page includes counts of the overall number of entities in the Resource Manager model and the Service Impact model, updated regularly.
- The export/import/reconciliation process has been re-implemented to improve accuracy, reduce reconciliation conflicts, and provide progress information.
- The zenimpactworker process is no longer necessary.

Update instructions

The update procedures for this release are unique and a special section has been created for them:

Updating Service Impact

The order of steps in the update procedures is crucial. Please review the procedures in advance, and follow the instructions carefully.

Known issues

- In previous releases, adding a dynamic service was very quick, because the Service Impact database included all of the devices and
 components in the ZODB. In this release, Service Impact creates a background job to copy the devices and components it requires,
 which can take a few minutes to complete. Scripts that utilize the Service Impact JSON API must be updated to wait for the job to
 complete before proceeding.
- When you change the metatype configuration, the Service Impact database is updated to add or remove nodes. Depending on which items are changed, processing the changes can take 30-90 minutes in very large environments.
- (IMP-306) The list of allowed characters in the names of dynamic services and dynamic service organizers is constrained. For more
 information, see Preparing to update to 5.4.x.
- (IMP-685) During the zenimpactgraph run --update process, you may receive a message similar to the following:

```
WARNING zen.ImpactGraph: Exception while adding impact
batch:'NoneType' object has no attribute '__module__', number tried:
9 (a retry number > 5)
```

Repeat the zenimpactgraph run -x catclean and retry the zenimpactgraph run --update process again.

ID	Description
IMP-69	The criteria for logical nodes must consider the numbering system of source events
IMP-276	The health check for webservice-status fails, which causes additional failures
IMP-306	Special characters not supported in service or organizer names

IMP-399	(IMP-557) Reconciliation does not consider relationships in imported graph
IMP-425	Null pointer exception in Neo4j before state change events stop processing
IMP-431	The zenimpactworker service times out during long graph updates
IMP-432	zenimpactgraph loses connection to zodb after a long graph update
IMP-435	Both device and component production state are sent to the impact server
IMP-438	Exports do not include logical nodes that are not part of a dynamic service
IMP-444	Inconsistent production states when graph updates are run during a maintenance window
IMP-450	No retry when certain add node operations fail
IMP-451	Rollback exception not handled properly
IMP-452	updateGraph API cannot support large number of interlocking changes in one transaction
IMP-459	Upgrading the LinuxMonitor ZenPack fails due to large number of model changes at once
IMP-465	Strange behavior when following dynamic service member link
IMP-475	Can't add a service or organizer because Submit button is inactive
IMP-476	The Impact view does not support the dark theme in the Resource Manager browser interface
IMP-482	In some cases, Impact events are not shown on a service's Events view
IMP-490	The Impact View does not immediately show updates to the model
IMP-514	A warning message is displayed constantly during normal use
IMP-543	The upgrade.sh script is not working properly
IMP-552	Impact does not provide accurate data to the Zenoss call home feature
IMP-559	Loading search results is slow on larger devices with many components
IMP-572	Value for check-box in Suppress service events is not persistent
IMP-573	Changing a service name does not propagate everywhere
IMP-585	Error when attempting to save a policy with empty fields
IMP-586	Policies are not included in service export/import
IMP-588	Import process does not include progress information
IMP-589	Production state changes during maintenance windows are not reflected in Impact
IMP-603	Events that match logical node criteria aren't processed
IMP-616	Font color in Impact portlet makes text difficult to read
IMP-625	Removing Impact components takes many seconds with no UI notification
IMP-651	Indexing is slow
IMP-654	Unable to click an object in the Impact View and go to the device in Resource Manager

IMP-648, IMP-657	Graph update takes a long time on a large system
IMP-666	Warning message Could not adapt during graph update
IMP-671	ZenPack update fails due to Impact state changes
IMP-672	Restoring omitted components is not working
IMP-673	Unable to create file for edges due to missing parent directory

Service Impact 5.3.1

This release features the enhancements that were introduced in version 5.3.0:

- Faster graph updates and state propagation in environments with many nodes.
- A new right-click menu option enables you to center the Impact View on a node that you select. The graph shifts to display the selected
 node in the center, but does not change the zoom level. The new Selected Node field enables you to select from a list of nodes that
 match the partial text string that you specify. Enhanced filtering enables you to find and view nodes by availability and performance
 states and partial name string.

The following table identifies the files to download for each supported installation or upgrade scenario.

Resource Manager	Required files
6.x	ZenPacks.zenoss.ImpactServer-5.3.1.0.0-py2.7.egg
5.3.x	ZenPacks.zenoss.Impact-5.3.1.0.0-py2.7.egg
5.2.x	install-zenoss-impact_5.3_5.3.1.0.0.run

Download files from delivery.zenoss.com. Use your Zenoss Support credentials to log in.

ID	Description
IMP-39	GraphML file that was exported from an older version of Service Impact cannot be imported into latest version.
IMP-284	Implicit bug in setting event state during propagation process.
IMP-285	Improve performance and responsiveness under high workload environments.
IMP-290	Do batching of production state updates in Service Impact server.
IMP-307	In a large database, cannot remove nonexistent nodes because requests time out.
IMP-309	Impact state propagation takes too long on devices with thousands of components.
IMP-316	Multithreaded implementation of related event processing.
IMP-320	Unable to delete top level logical node organizer when it contains children.
IMP-321	A state node accumulates best state events.
IMP-322	Import of a GraphML file associates incorrect devices to components.
IMP-323	Need to repair Neo4j objects with large number of non-relevant events.
IMP-349	Refactor handling Neo4j resources in multi-threaded environment.
IMP-351	When updating a graph, errors occurr for some ZenPack objects.

IMP-357	State propagation process takes an unacceptable amount of time on devices with thousands of components.
IMP-369	graphreset (update) does not prune orphaned nodes.

Considerations and workarounds

Reidentifying devices

Resource Manager provides the ability to reidentify devices. The reidentification process deletes and re-adds the device with a new ID and GUID. When the GUID is changed, the device is removed from that particular Service Impact service. If you reidentify a device, you must manually readd the device to the service model.

Impact graph update best practices

Graph updates and maintenance window operations use the same target graph database. Concurrent access of shared data increases time required to complete the operations, risk of transaction rollbacks and deadlocks, and risk of inconsistent state updates to the graph database. For best performance when updating an impact graph,

- · Do not manually rebuild an impact graph during a time that overlaps a maintenance window or another graph update operation.
- Do not import dynamic service models while a graph update operation is in progress.

For more information, see Manually rebuilding an impact graph.

Upgrade considerations

When you initially upgrade from Service Impact 5.2.3 to 5.3.1, the new version of the product removes accumulated event history that is no longer needed. A temporary performance slowdown might occur while nodes are read.

Limitations

After Service Impact is installed, Service Impact and Resource Manager are interdependent. However, Resource Manager issues affect Service Impact more frequently than Service Impact issues affect Resource Manager. For this reason, the list of known issues for a given Service Impact release might include items that manifest in Service Impact but are not caused by Service Impact software. Such items are noted in the list of known issues.
