System Simulation with Digital Computer

Narsingh Deo

Contents

		xii
	Contents	
	4-1. Fundamentals of queuing theory	141
63	4-2. Simulation of a single-server queue	161
72	4-3. Simulation of a two-server queue	176
76	4-4. Simulation of more general queues	182
82	4-5. Remarks and references	184
84	4-6. Exercises	187
8.8	1.8 INTRODUCTION 1-14	
	1-1. Simulation of a pure-pursuit problem—an example	1
	1-2. A system and its model	5
88	1-3. Simulation of an inventory problem	5
90	1-4. The basic nature of simulation	9
92	1-5. When to simulate	10
98	1-6. Remarks and references	11
99	1-7. Exercises	12
100	2-6. Computer program for simulation	100
104	2. SIMULATION OF CONTINUOUS SYSTEMS 15-39	
107	2-1. A chemical reactor	15
108	2-2. Numerical integration vs. continuous system simulation	19
110	2-3. Selection of an integration formula	20
	2-4. Runge-Kutta integration formulas	22
	2-5. Simulation of a servo system	25
112	2-6. Simulation of a water reservoir system	27
117	2-7. Analog vs. digital simulation	31
121	2-8. Remarks and references	33
128	2-9. Exercises	35
131	6-2. Simulation Example-2	6-2
132	3. DISCRETE SYSTEM SIMULATION 40-61	
140	6-7. Remarks and references	6-7
141	6-8. Exercises	6-8
	3-1. Fixed time-step vs. event-to-event model	40
	3-2. On simulating randomness	42
	3-3. Generation of random numbers	43
	3-4. Generation of non-uniformly distributed random numbers	50
44	3-5. Monte-Carlo computation vs. stochastic simulation	56
52	3-6. Remarks and references	57
60	3-7. Exercises	59
63	7-4. Validation	7-4

4. SIMULATION OF QUEUEING SYSTEMS	62-87	
4-1. Rudiments of queueing theory		
4-2. Simulation of a single-server queue		63
4-3. Simulation of a two-server queue		72
4-4. Simulation of more general queues		76
4-5. Remarks and references		82
4-6. Exercises		84
		85
5. SIMULATION OF A PERT NETWORK	88-111	
5-1. Network model of a project		88
5-2. Analysis of an activity network		90
5-3. Critical path computation		92
5-4. Uncertainties in activity durations		98
5-5. Simulation of an activity network		99
5-6. Computer program for simulation		100
5-7. An example		104
5-8. Resource allocation and cost considerations		107
5-9. Remarks and references		108
5-10. Exercises		110
6. INVENTORY CONTROL AND FORECASTING	112-143	
6-1. Elements of inventory theory		112
6-2. More complex inventory models		117
6-3. Simulation Example—1		121
6-4. Generation of Poisson and Erlang variates		128
6-5. Simulation Example—2		131
6-6. Forecasting and regression analysis		135
6-7. Remarks and references		140
6-8. Exercises		141
7. DESIGN AND EVALUATION OF SIMULATION EXPERIMENTS	144-168	
7-1. Length of simulation runs		144
7-2. Variance reduction techniques		155
7-3. Experimental layout		160
7-4. Validation		162

7-5. Summary and conclusions	164
7-6. Remarks and references	165
7-7. Exercises	166
8. SIMULATION LANGUAGES 169-197	
8-1. Continuous and discrete simulation languages	170
8-2. Continuous simulation languages	170
8-3. Block-structured continuous simulation languages	171
8-4. Expression-based languages	175
8-5. Discrete-system simulation languages	181
8-6. SIMSCRIPT	183
8-7. GPSS	186
8-8. SIMULA	187
8-9. Factors in selection of a discrete system simulation language	189
8-10. Remarks and references	193
INDEX 198-200
