Inorganic Chemistry*

Contents

PART I ATOMIC AND MOLECULAR STRUCTURE	
CHAPTER 1 ATOMIC STRUCTURE	1
Wave Properties of Electrons	1
Description of the Position and Momentum of an Electron	2
Mathematical Description of Waves	3
The Schrödinger Equation	5
The Solution of the Schrödinger Equation	6
Quantum Numbers	8
The Physical Picture of Atomic Orbitals	12
Extension of the Wave Equation to Atoms Other Than Hydrogen	18
Relative Energies of the Orbitals	20
Term Symbols and the Vector Method	23
Term Symbols for Excited States	26
CHAPTER 2 BONDING	30
The Variation Principle	30
Treatments of the Hydrogen Molecule	34
Electron Exchange Interaction	37
Applications of Valence Bond Theory	37
The General Molecule XY – Electronegativity	37
More Complicated Molecules – Resonance	38
The Overlap of Atomic Orbitals	40
Hybrid Orbitals	42
Hybrids Involving <i>d</i> Orbitals	45
Energetics of Hybrid Bond Formation	47
Nonequivalence of Orbitals	49
σ and π Bonds	51

Applications of Molecular Orbital Theory	53
Molecular Orbitals for Homonuclear Diatomic Molecules	53
Molecular Orbitals in Heteronuclear Diatomic Molecules	58
Electron Deficient Molecules	60
A Delocalized π Electron System	62
Molecular Orbital Description of Some Interhalogen Molecules	64
Qualitative Comparison of the Valence Bond and Molecular Orbital Approaches	64
Electrostatic Bonding	65
Ionic Bonding	65
Ion-Dipole	66
Dipole-Dipole	67
Dipole-Induced Dipole	67
London Dispersion	68
Hydrogen Bonding	68
Covalence and Polarizability	68
The Hydrogen Bond	69
CHAPTER 3 LIGAND FIELD AND MOLECULAR ORBITAL DESCRIPTION OF BONDING IN COMPLEXES	74
Ligand Field Theory	74
Shapes and Positions of the Orbitals	74
Six-Coordinate Complexes	74
Four-Coordinate Complexes	82
Summary of the d -Level Splittings	86
Ligand Field Strengths – Colors of Complexes	86
The Molecular Orbital Theory of Bonding in Complexes	87
PART II SPECTROSCOPIC METHODS	
CHAPTER 4 SYMMETRY AND THE CHARACTER TABLES	
Introduction	99
Symmetry Elements	100
The Center of Symmetry or Inversion Center	100
The Rotation Axis	101
The Mirror Plane or Plane of Symmetry	103
The Rotation-Reflection Axis; Improper Rotations	105
The Identity	106
Point Groups	107
Group Theory and the Character Table	111
Space Symmetry	118

CHAPTER 5 GENERAL INTRODUCTION TO SPECTROSCOPY	121
Nature of Radiation	121
Energies Corresponding to Various Kinds of Radiation	122
Energies for Atomic and Molecular Transitions	124
Selection Rules	126
General Applications	127
Determination of Concentration	127
“Fingerprinting”	130
Isosbestic Points	131
CHAPTER 6 ELECTRONIC ABSORPTION SPECTROSCOPY	135
Vibrational and Electronic Energy Levels in a Diatomic Molecule	135
Introduction to Electronic Transitions	137
Relationship of Potential Energy Curves to Electronic Spectra	137
Nomenclature	139
Assignment of Transitions	144
Oscillator Strengths	147
Intensity of Electronic Transitions	148
Polarized Absorption Spectra	150
Charge Transfer Transitions	151
Applications	151
Fingerprinting	152
Molecular Addition Compounds of Iodine	155
Effect of Solvent Polarity on Charge Transfer Spectra	158
Spectra of Transition Metal Complexes	161
Selection Rules and Intensities of the Transitions	161
Nature of Electronic Transitions in Complexes	162
d^2 , d^7 , d^3 , d^8 Configurations	164
Use of Orgel Diagrams	167
Calculation of Dq and β for Ni^{II} Complexes	168
Structural Evidence from Electronic Spectra	175
Miscellaneous Applications of the Principles Related to Electronic Transitions	181
CHAPTER 7 VIBRATION AND ROTATION SPECTROSCOPY: INFRARED, RAMAN, AND MICROWAVE	187
Introduction	187
Harmonic and Anharmonic Vibrations	187
Absorption of Radiation by Molecular Vibrations —	
Selection Rules	189
Force Constant	190

Vibrations in a Polyatomic Molecule	191
Effects Giving Rise to Absorption Bands	192
Normal Coordinate Analyses and Band Assignments	195
Group Vibrations	196
Limitations of the Group Vibration Concept	196
Raman Spectroscopy	199
Polarized and Depolarized Raman Lines	202
Significance of the Nomenclature Used To Describe Various Species	202
Use of Symmetry Considerations To Determine the Number of Active Infrared and Raman Lines	203
Symmetry Requirements for Coupling Combination Bands and Fermi Resonance	210
Microwave Spectroscopy	210
Determination of Bond Angles and Bond Distances	211
Measurement of the Dipole Moment of a Molecule	212
Rotational Raman Spectra	213
Applications of Infrared and Raman Spectroscopy	213
Procedures	213
Fingerprinting	218
Spectra of Gases	222
Application of Raman and Infrared Selection Rules to the Determination of Inorganic Structures	226
Hydrogen Bonding Systems	229
Changes in the Spectra of Donor Molecules upon Coordination	230
Change in Spectra Accompanying Change in Symmetry upon Coordination	232
CHAPTER 8 NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY	239
Theory of NMR Spectroscopy	239
The Chemical Shift	244
Chemical Shifts of Some Systems Studied by NMR	250
Mechanism of Electron Shielding and Factors Contributing to the Magnitude of the Chemical Shift	253
Chemical Shifts for Which the Local Diamagnetic Term Does Not Predominate	258
Spin-Spin Splitting	260
Spin-Spin Coupling Mechanism for Transmitting Nuclear Spins	265
Applications of Spin-Spin Coupling to Structure Determination	266
Applications Involving the Magnitude of Coupling Constants	270
Complex Spectra Obtained When $J \sim \Delta$	274

Chemical Exchange and Other Factors Affecting Line Width	279
Effect of Chemical Exchange on Spectra and the Evaluation of Reaction Rates for Fast Reactions	281
Consequences of Nuclei with Quadrupole Moments in NMR	290
The Double-Resonance Technique	291
NMR Studies of Exchange Reactions Between Ligands and Metal Ions	294
NMR of Paramagnetic Complexes – Contact Shifts	298
Miscellaneous Applications of NMR to Inorganic Problems	303
CHAPTER 9 NUCLEAR QUADRUPOLE RESONANCE SPECTROSCOPY	315
Introduction	315
Effect of a Magnetic Field on the Spectra	319
Relationship Between the Electric Field Gradient, q , and Molecular Structure	320
Applications	321
The Interpretation of eQq Data	321
The Effects of Crystal Lattice on the Magnitude of eQq	323
Structural Information from NQR Spectra	323
CHAPTER 10 ELECTRON PARAMAGNETIC RESONANCE SPECTROSCOPY	328
Introduction	328
Presentation of the Spectrum	330
Hyperfine Splitting in Some Simple Systems	331
Hyperfine Splittings in Various Structures	332
Factors Affecting the Magnitude of the g Values	338
Interactions Affecting the Energies of Unpaired Electrons in Transition Metal Ion Complexes	341
Zero-Field Splitting and Kramers' Degeneracy	342
Anisotropy in the Hyperfine Coupling Constant	346
Nuclear Quadrupole Interaction	348
The Spin Hamiltonian	349
Line Widths in Solid State EPR	350
Electron Delocalization	351
Applications	352
Rate of Electron Exchange Reactions by EPR	355
Miscellaneous Applications	356
CHAPTER 11 MÖSSBAUER SPECTROSCOPY	362
Introduction	362

Resonance Line Shifts From Change In Electron Environment	366
Quadrupole Interactions	366
Magnetic Interactions	367
Applications	368
CHAPTER 12 MASS SPECTROMETRY	
Introduction	374
Operation and Representation of Spectra	374
Process That Can Occur When a Molecule and a High Energy Electron Combine	374
Applications	378
Fingerprint Application and the Interpretation of Mass Spectra	380
Effect of Isotopes on the Appearance of a Mass Spectrum	380
Molecular Weight Determinations	382
Evaluation of Heats of Sublimation and Species in the Vapor over High Melting Solids	385
Appearance Potentials and Ionization Potentials	385
Appendix A. Magnetism	386
Contributions to Magnetic Properties	389
Effect of the Ligand Field on Spin-Orbit Coupling	389
Measurement of Magnetic Properties	391
Some Applications of Magnetic Data	393
Temperature Dependence of Magnetism	394
Appendix B. Character Tables for Selected Point Groups	396
Appendix C. Tanabe and Sugano Diagrams for O_h Fields	398
Appendix D. Calculation of $Dq(\Delta)$ and β for O_hNi^{II} and T_dCo^{II} Complexes	403
Calculation of Δ And β For T_dCo^{2+} Complexes	410
Appendix E. Normal Vibration Modes for Common Structures	411
Appendix F. Conversion of Chemical Shift Data	414
Index	421
	423
