

THE SPIRIT OF 'C'

AN INTRODUCTION TO MODERN PROGRAMMING

MULLISH COOPER

Contents

Preface x
Prologue The History of C xii

1 Elementary Programming 1

A Typical C Program 2
The Structure of a Simple Program 3
The *printf* Function 4
The *The newline* Character 5
The Use of the Semicolon 6
The Use of Braces 6
The Use of Comments in a Program 7

2 An Introduction to Declarations, Assignments and Variables 15

The Concepts of an Integer 16
The Concept of a Variable 16
Declaring an Integer Variable 17
The Rules for Naming Variables 17
Guidelines for Selecting Variable Names 18
The Assignment Statement 19
The Four Arithmetic Operators 23

3 Integer Arithmetic Expressions 31

The Combined Declaration-Initialization Statement 32
The Truncation Effect of Integer Division 32
The Relative Priority of the Arithmetic Operators 34
The Use of Parentheses 34
The Modulus Operator 35
The Unary Minus Operator 37

4 Some More Data Types 45

Floating Point Numbers 46
Scientific Notation 47

	The Type double	48
	Converting Integers to Floating Point, and Vice Versa	48
	Mixed-Mode Calculations	49
	Coercion and the Cast Operator	49
	Using Qualifiers to Extend the Accuracy of Integers	50
	The Type char	51
	Keywords	52
5	Making Decisions in C	59
	The <i>scanf</i> Function	60
	Decision Making in C	61
	The Relational Operators	61
	The Logical Operators	62
	Precedence of Operators	63
	The if Statement	64
	The if...else Statement	65
	Nesting of if Statements	67
6	The while and do...while Loops	83
	The Updating Assignment Operators	84
	The Increment and Decrement Operators	85
	The while Loop	86
	An Enhancement of the <i>printf</i> Function	91
	Boolean Values	91
	The Position of the Increment and Decrement Operators	93
	The do...while Loop	94
	The Trailer Technique	98
7	The for Loop	117
	The for Loop	118
	Defining Constants, and the C Preprocessor	123
	A Word to the Wise	126
	Nesting of for Loops	128
	Validating Input	131
	The Newton-Raphson Iteration Method	132
	Specifying the Number of Decimal Places to be Printed	133
	Expanding the for Loop by Using the Comma Operator	133
8	A Detailed Look at the <i>printf</i> and <i>scanf</i> Functions	147
	The Conversion Specifications for <i>printf</i>	148
	Type char and the ASCII Code	151
	Escape Sequences and Control Characters	157

- Octal and Hexadecimal Notation 159
- Character Strings and How to Print Them 161
- Some Final Comments on the *printf* Function 164
- The Conversion Specifications for *scanf* 166

- 9 User-Defined Functions 183**
 - What is a Function? 184
 - Why Use Functions? 185
 - Functions and Structured Programming 185
 - Returning a Value from a Function 189
 - Local and Global Variables 190
 - Parameters 194
 - Declaring the Type of a Function 199
 - Boolean Functions 201
 - Functions with More Than One Parameter 202

- 10 Arrays 223**
 - What is an Array? 224
 - Declaring an Array 225
 - Initializing an Array 228
 - The *break* Statement 232
 - The Assignment Operator Within an Expression 236
 - Strings and Character Arrays 238
 - Finding the Minimum and Maximum of an Array 241
 - Sorting an Array 243
 - Declaring Variables Within Compound Statements 246
 - The Conditional Expression 249
 - Multidimensional Arrays 254

- 11 Pointers and Indirection 275**
 - The Concept of Pointers 276
 - The Address Operator 276
 - The Indirection Operator 278
 - Passing Pointers as Parameters 280
 - Arrays and Pointers 281
 - Passing by Value and Reference 286
 - Address Arithmetic 287
 - Pointers and Two-Dimensional Arrays 290
 - The *switch* Statement 291
 - Arrays of Pointers, and Pointers to Pointers 300
 - Sorting by Pointer 301
 - Sorting a String Array by Pointer 306
